PAYPHONES OF ARGENTINA

Argentina has two phone companies: Telefónica in the south and Telecom in the north. Buenos Aires is divided between the two. Both companies use the same tokens but their cards aren't compatible. See if you can guess which phones belong to which companies. See if you can guess which one we're not sure about.

SEND YOUR PAYPHONE PHOTOS TO: 2600 PAYPHONES, PO BOX 99, MIDDLE ISLAND, NY 11953. TAKE US WHERE WE HAVEN'T GONE!

Crime Waves

A decade is a long time to be doing anything. When we first started this project back in the summer of 1983, nobody could have predicted our growth, or even our existence in 1994. It's pretty strange to look back at the early days when we literally stuck around in offices and alleyways to get our first issues printed. And today you can find us in chain stores. Reality has always been weird to us.

Of course, if we had just been doing the same thing for ten years, we would all be abject failures. Fortunately, the hacker world is such that you can spend a long time within it and never feel the kind of boredom that has become such an important part of the average American's life. There is always something happening in this world, always something new to explore and discover, more knowledge to share, more friends to meet for the first time. The last ten years have been tinged with hilarity and fun, but also sadness, fear, anger, and determination. One thing these years have not been is a waste of time.

We know that with every page we turn, there is a risk. The most obvious of these include passing off the powerful corporations and their law enforcement drones. Each and every time we share knowledge, we engage in a conspiracy of some sort. We risk having our lives disrupted by our accusers, our very means of learning taken from us by large armed men. We risk being chastised by our friends and family for being different and ostracized in school for not asking the proper questions or memorizing the standard answers.

These are the obvious risks of who we

are and what we do. Most of us have come to recognize them. But there is a far greater risk facing us and it's one that many of us could fall victim to with little or no warning.

Over the years, we've tried to dispel the myth that hackers are criminals. This has been most difficult. As the tabloid press loves to scream, hackers can get into your credit file. But so can anybody else. Hackers can make thousands of dollars of long distance calls. Anyone is capable of this unimpressive feat. Hackers can break into thousands of sensitive computer systems around the world. And the holes will still be there if we never try.

What the press fails to see is the distinction between hacking for the sake of adventure and using hacker knowledge for personal profit. To them it's all the same. Somebody who sells phone codes is the same person as somebody who manipulates the telephone network in wild and imaginative ways. By defining the two as one and the same, we could actually find ourselves being nudged into criminal behavior because it's what's expected of us.

With this in mind, the massive growth of the hacker community is cause for concern. Many people are being drawn into our fold through these very same media perceptions. People have shown up at our meetings assuming that we're there to sell or buy codes. A disturbing number of people who engage in credit card fraud, that is, the stealing of actual physical, tangible merchandise, are trying to ingratiate themselves into the hacker community. It's not surprising. And they might actually be able to prey on our

temptations and suck some hackers into their midst, thereby learning a few new tricks. And by calling *themselves* hackers, they manage to justify what it is they do. Ironically, their technical prowess oftentimes doesn't extend beyond knowing how to operate a red box or punch in a code.

This kind of thing was inevitable, given the growing awareness that the mainstream world, and hence the mainstream criminal world, has developed for hackers. Carrots are being dangled in front of our faces. Our brains are suddenly in demand. You might say that society has finally found a use for us.

Knowing this, the most important thing as individuals is to realize why we do what we do. Is it that we want to find out things and spread knowledge around? Or do we want to get what we feel the world owes us? Are we trying to survive and get access to a locked world? Or are we intent on selling our knowledge to the highest bidder?

Truthful answers to these questions are more valuable than anything else. Once we understand our motivation, we can at least be honest with ourselves. Those who use their hacker knowledge to embark upon a life of crime can at least admit to themselves that they are now criminals, thereby salvaging some self-respect. The rest of us will have some sense of where we draw our lines.

But how do we know what constitutes criminal behavior and what does not? Regrettably, the law no longer seems an accurate definer. With many of us, we just know when something doesn't feel right. And in such a case, trusting your instincts is always a good idea.

To be a hacker, your primary goal

must be to learn for the sake of learning, just to find out what happens if you do a certain thing at a particular time under a specific condition. A good way to know if you're a genuine hacker is to look at the reaction of the non-hackers around you. If most of them think you're wasting your time doing something incomprehensible that only you can appreciate, welcome to the world of hacking. If, however, you find yourself being trailed and hounded by a bunch of drooling wannabes with a list of plots and schemes to make your knowledge "pay off" in a big way, you're probably on the verge of becoming a criminal and leaving the rest of us back in the age of innocence.

Obviously, embarking on such a journey en masse would mean the end of the hacker world. We would play right into the hands of our enemies and criminalize hacking by definition, rather than by legislation. Nothing would be better for the anti-hacker lobbyists. As a curious side note, in more than one instance, people who were found to have been helping the government prosecute hackers have been caught actively encouraging criminal behavior among hackers. We have to wonder.

We hack because we're curious. We spread what we find because segregated knowledge is our common enemy. This means that some opportunists will get a free ride and run the risk of giving the rest of us a bad name. The only surefire way to keep this from happening is for us to behave like the phone companies and restrict knowledge. Not likely.

It's not our job to catch criminals. But it is our moral obligation to keep our noble, if somewhat naive, aspirations from becoming subverted by those who truly don't understand.

build a dtmf decoder

by Xam Killory

When I saw the product review of the TDD-8 DTMF Decoder in the Summer 1993 2600 Magazine, the last line got me thinking: "A pity that like a lot of good tools, it's so expensive." So I designed this decoder around the Telstone 8870 DTMF Receiver IC, the same part used in the TDD-8 product that was reviewed. Originally, I intended to make a tone decoder that would display the current digit and simultaneously send it out over a serial line. No problem, I thought. So I started bread boarding it together, and soon realized it would actually take two shift registers, a stable clock generator, a custom burned PROM (to translate from four-bit binary to ASCII phone-pad symbols), and an RS-232 voltage level driver (because RS-232 voltages are different than TTL voltage levels).

"What I want," I thought in annoyance,

"is a cheap computer to do all this conversion and communication and logging crap for me." And I had just such a thing sitting in my closet gathering dust. Years ago, the Commodore 64 was a very popular consumer computer, and there are millions of them floating around. They have a current street value of about \$50, because they can't compare to any of the current computing muscle out there, but they are still enormously useful as a hacker's tool. They're durable, self-contained, and if you do blow one up experimenting, you don't feel nearly as bad as you would if you had just fried your \$1400 Macintosh. And

for bit manipulations and other "hacker

applications", the C-64 is actually much easier to use than a "real computer."

The Mac and PC are designed to be used by people who should never need to get to the guts of the computer. Running applications is easy. But if you want to write code, you need to get a compiler, write a source file, compile it, link it, and then run it. If you want to build your own I/O devices, you'd better be a very good hardware

designer. But when you turn on a Commodore 64, you are immediately in a BASIC interpreter, and getting to machine level from there is not very difficult. If you want to read a memory value, you just PEEK at it from BASIC. And there are multiple I/O ports to play with, all very easy to get to.

In this article, I'll show you everything you need to build a stand-alone DTMF decoder, with a one digit display. You can even order all the parts as a kit (see sidebar) and solder it together in about 20 minutes. And then if you want all the logging capabilities of a much more expensive dedicated DTMF decoder, I'll show you how to interface this project to a Commodore-64, or even a VIC-20 Computer (street value: about \$10). With this DTMF decoder as an input device, you can decode and list touch tones from any audio source, and you can even make other applications that use touch tone control. With a telephone input, you can feed commands to your application remotely with a touch tone phone. With a radio input, you can make an amateur radio repeater controller. The applications are limited only by your imagination.

Some people might look at this and say, why a Commodore 64? There are several reasons I chose this particular computer. It's easy to use, especially for these sorts of projects. Lots of people have them already, and if you don't have one you can probably pick one up at a garage sale (I've seen them for as little as \$20). Please understand, I'm not advocating retrograde technology. There is no substitute for a Pentium when you're playing X-Wing or running Crack on someone's password file, but there are also applications that don't need all that power, and with this project goes to a seven-segment decode/decoder, which is IC2, a 7447. The use of an off-the-shelf part like the 7447 is convenient and cheap, but provides one problem: the decoder IC doesn't output a binary 0 for an input touch tone digit of "0". Furthermore, all the other non-numeral digits (A, *, A.B, C, D) are also rendered as symbols by the decoder IC. See "Circuit Operation" section below. The 7447 drives a common anode

projects will also give you some ideas, so you can design and build your own custom tools.

Of course, if you don't have and don't know enough about the hardware interface, you can always hook this DTMF decoder to any computer of your choice, even a PC or Macintosh. The operation and outputs are explained below. The rest is left as an exercise to the reader.

Circuit Description

This section is for anyone who really wants to know what every part of the circuit is doing. If you don't really care, this is isn't vital and you can skip to the next section, "Circuit Construction".

The schematic diagram for this project is shown in Figure 1. The three major components are the DTMF Receiver IC (IC1), the display driver IC (IC2), and the seven-segment LED that displays the current digit. All the other parts provide power, support, and input conditioning for the circuit.

The capacitor in the audio input path (C1) is to block any DC in the audio input signal. The resistors (R1 and R2) form the audio amplifier feedback loop, which in this circuit ($R1=R2=100K$) sets the gain of the internal differential input amplifier in the 8870 to unity. The crystal used by IC1 to generate its internal clock (X_1) is a standard 3.58 MHz colorburst crystal.

Finally, R3 and C2 form an RC timing delay that determines how long a tone must be present on the input to be considered valid, and then how long it must be off before the next tone is considered a "new" tone. With the values chosen here ($R3=330K$, $C2 = 1uF$), the time for a tone to be considered valid is about 40 milliseconds.

The four-bit decoded output of the 8870 goes to a seven-segment decode/decoder, which is IC2, a 7447. The use of an off-the-shelf part like the 7447 is convenient and cheap, but provides one problem: the entire process of etching and drilling circuit boards is beyond the scope of this article. Because there are traces running in between IC pins on this board, the layout tolerances are fairly tight. If you have never made a printed circuit board before I strongly suggest you purchase the pre-fab

seven-segment display on which the decimal point serves as a power-on and valid-tone indicator. Resistor R4 limits the total current that the LED can draw.

Because the 7447 has internal limiting resistors, R4 can be left out, and the display will be much brighter but still not burn out. The disadvantage to having R4 in place is that the display will get dimmer when there are more segments on. For example, a numeral "1", which has only two

segments, is considerably brighter than a numeral "8" which uses all seven of the segments. The advantage to having R4 however, is that it limits the current drawn by the entire circuit and makes the total current drain more uniform over time. This is particularly useful if you intend to power the circuit from the host computer bus, where current drain may be an issue (see "Computer Interface" section).

When operating without power from the host computer, or in a stand-alone configuration, power is provided to the circuit by a voltage regulator (IC3) which sources 5V from any input voltage between about 7.5V and 20V. The circuit is intended to be used with a 9V battery (attached to COM1).

Circuit Construction

You will need several tools to begin: wire cutters, wire strippers, a low-wattage soldering iron, and some rosin core (not acid core) solder. You will also want a heat gun or hot air gun (such as an alligator clip), and a well-lit workspace where you can drip solder.

The entire circuit can be built on a single-sided printed circuit board 45mm x 65mm. The artwork for the board is shown actual size in Figure 2. This shows the copper traces as they should actually appear on the underside (opposite from component side) of the circuit board. The best way to fabricate the circuit board is photographically, but walking through the entire process of etching and drilling circuit boards is beyond the scope of this article. Because there are traces running in between IC pins on this board, the layout tolerances are fairly tight. If you have never made a printed circuit board before I strongly suggest you purchase the pre-fab

Figure 1 - Circuit Schematic

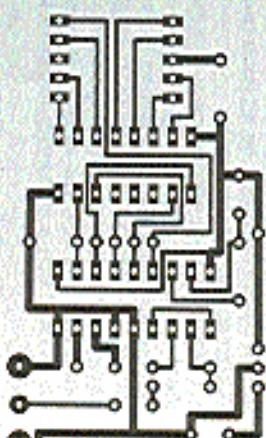

Figure 2 - Printed Circuit Board Artwork (Actual Size)

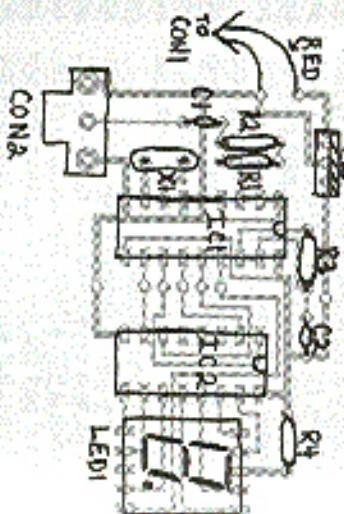

Figure 3 - Component Layout Guide

board, or the entire kit (see sidebar). The circuit is also simple enough that you can assemble it on perf-board, using the schematic in Figure 1, without the printed circuit board, but it won't be as durable or reliable.

The component layout on the top (blank) side of the circuit board is shown in Figure 3. Insert each component in the board, and then solder it in place and trim its leads off. It's easiest if you begin with the resistors, because the board can rest on them while you solder them in place. The rest of the components can then be inserted in order by height, from shortest to tallest, starting with IC1 and IC2, and ending with the voltage regulator (IC3).

Make sure that the board surface is clean before you begin soldering. Rubbing it down with rubbing alcohol and then wiping off any excess will insure that there is no grease from your fingers. When you solder the parts, remember that the components, particularly the ICs and the LED, are susceptible to thermal damage if you get them too hot. This means that you should use a heat sink (such as an alligator clip connected on the component side) on the leads of the ICs as you solder them. You should make sure that you only apply the soldering iron to the component leads for the minimum time needed to get a good clean solder joint.

Also make sure that you get the ICs in the board with the correct orientation. They will fit in two different directions, but you must have the end with the notch toward the edge of the board with the voltage regulator. The voltage regulator also has only one correct orientation, which is with the front (the labeled side) facing toward the ICs and the metal tab facing the edge of the board. If you put it in backwards, the circuit will not work. The decimal point on the seven-segment display should be toward the edge of the board. Make sure you put the red lead on the battery connector (CON1) in the hole closer to the voltage regulator (IC2). If you are not certain of the correct orientation of any of these parts (IC1, IC2, IC3, LED1, or CON1), study Figure 3 and make sure you have them oriented correctly before you

solder them in place.

When the circuit is finished, there should be seven unfilled holes between IC1 and IC2 (which is where the computer interface is connected, see below).

Circuit Operation

The component layout on the top (blank) side of the circuit board is shown in Figure 3. Insert each component in the board, and then solder it in place and trim its leads off. It's easiest if you begin with the resistors, because the board can rest on them while you solder them in place. The rest of the components can then be inserted in order by height, from shortest to tallest, starting with IC1 and IC2, and ending with the voltage regulator (IC3).

Make sure that the board surface is clean before you begin soldering. Rubbing it down with rubbing alcohol and then wiping off any excess will insure that there is no grease from your fingers. When you solder the parts, remember that the components, particularly the ICs and the LED, are susceptible to thermal damage if you get them too hot. This means that you should use a heat sink (such as an alligator clip connected on the component side) on the leads of the ICs as you solder them. You should make sure that you only apply the soldering iron to the component leads for the minimum time needed to get a good clean solder joint.

Also make sure that you get the ICs in the board with the correct orientation. They will fit in two different directions, but you must have the end with the notch toward the edge of the board with the voltage regulator. The voltage regulator also has only one correct orientation, which is with the front (the labeled side) facing toward the ICs and the metal tab facing the edge of the board. If you put it in backwards, the circuit will not work. The decimal point on the seven-segment display should be toward the edge of the board. Make sure you put the red lead on the battery connector (CON1) in the hole closer to the voltage regulator (IC2). If you are not certain of the correct orientation of any of these parts (IC1, IC2, IC3, LED1, or CON1), study Figure 3 and make sure you have them oriented correctly before you

Once you have built the circuit, turn it on by connecting the 9V battery. The decimal point on the LED should light up. You're now ready to decode DTMF tones. Connect a tone source to the audio input. When the circuit receives a "valid" touch tone, it displays the value on the seven-segment LED. When a valid tone is applied to the input, the decimal point will turn off. Once a tone has stopped, the decimal point will light again, and the number will remain on the display until the next valid tone is received.

One quirk of using an off-the-shelf DTMF receiver is the way a touch tone "0" is displayed. Because the 8870 doesn't output a binary 0 for the tone "0", it is actually displayed as one of the non-numeral symbols. A touch tone "D" is what is displayed as a "0" on a seven segment LED. Table 1 shows all of the touch tone inputs, their binary outputs, and the symbol displayed on the seven-segment LED for each.

Computer Interface

Although this tone decoder can be used as a stand-alone device, it is difficult to catch multiple digits, because they are only displayed on the seven-segment display until the next tone comes along. Furthermore, if the same touch tone digit is received twice in a row, the only way you will tell from looking at the display is by seeing the decimal point blink off as the next valid tone arrives while the number or symbol displayed remains the same.

This decoder becomes really useful when you hook it to something that can record the digits as they occur, and keep them in memory or display them to a multi-digit display (like a screen). All we need is a computer with a binary input port. For this project, I used the user port on the Commodore 64. This is the card edge on the far right as you look at the back of the computer. The six holes on the decoder

Back of Commodore 64 or Vic-20

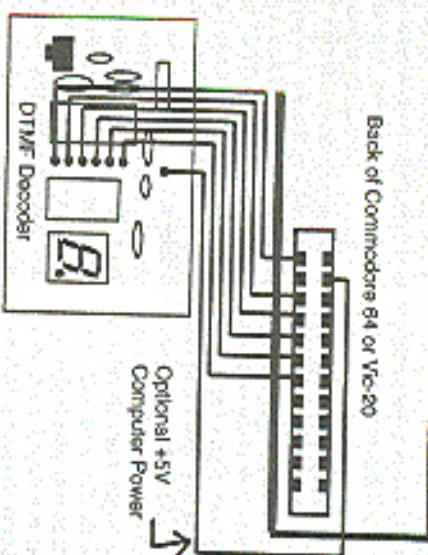

Figure 4 - Commodore 64/Vic-20 Interface Pinout

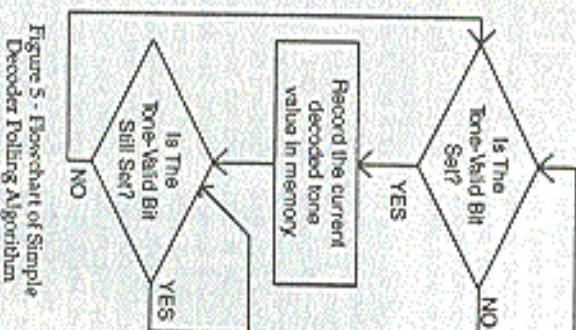

Figure 5 - Flowchart of Simple Decoder Polling Algorithm

circuit board between IC1 and IC2 are where you connect the board to the user port. The seventh hole (at the top of the Decoder) is an auxiliary power input, if you want to power the decoder circuit from the computer (and eliminates the need for batteries). Figure 4 shows which pins on the connector are connected to which holes on the board. The bottom-most hole on the board is the ground connection, the middle five holes are the four bits of the decoded digit and the valid bit. By connecting them to the user port, the state of the DTMF decoder is now reflected by the user port data byte in the computer's memory.

The algorithm for reading a digit in from the DTMF decoder is pretty straightforward. We just keep "polling" (checking the value of) the user port. If the valid bit is low (0), we check again. We look until the valid bit goes high (1), and then we record the current digit from the four-bit binary input. Then we wait for the valid bit to go low again before we start the whole process over. Figure 5 shows a flowchart of this process. The Commodore 64 is a very slow computer by current standards, but it is still blazingly fast compared to the speed that DTMF digits can arrive. So a program written even in the gloriously quick language of BASIC is plenty fast for our needs.

The sample program in Figure 6 is a DTMF number logging program. It scans for digits. If a digit is received, it prints it to the screen and waits for the next digit. If it gets a whole stream of digits, it will print them all on the same line. If it gets a "4" sign, or if there is a delay of more than three seconds until the next digit, it will skip to the next line and print any subsequent digits there. Numbers are not stored in memory, so once they scroll off the top of the screen, they are lost.

The code for the BASIC number logging program is broken down into subroutines and commented to indicate what is happening where. You can use this as a guide to writing your own code, or you can just copy sections of this program into your own. The possibilities of what you can do with this are limited only by your imagination. It's up to you.

And now you have a DTMF decoder. It's

cheaper than an equivalent commercial product, and it offers a chance to start your own hacker's tool kit, in the spirit of the earliest pioneers who built all their own equipment. Good luck and have fun.

SIDE-BY-SIDE

Part List, Kit Ordering Information

Many of the parts for this kit are available at Radio Shack, and have Radio Shack part numbers in parentheses next to them. The rest are fairly common and can be found at electronic hobby supply stores or from parts distributors. I've also contacted with Millennium Systems to provide all the parts and the printed circuit board in kit form. They also sell just the printed circuit board, if you prefer.

R1, R2, 100K Ohm (271-1347)

R3 - 330K Ohm (271-1315)

C1, C2 - 1 microfarad (272-1069)

470K Ohm resistor, Radio Shack part number 271-1354

X1 - 3.58 MHz Colorburst Crystal

LED - Common Anode Seven-Segment LED

IC1 - Telephone 8820-1 DTMF Receiver (You

can call Telephone # 1-800-426-3933 to find your

nearest distributor.)

IC2 - 7447 Display Decoder IC (276-1605)

IC3 - 7805 5V Regulator IC (276-1750)

CON1 - 9V Battery Clip (270-325)

Optional CON2 - Female RCA Phone Plug for Audio

Input (27-346), but this is not the printed

board art is designed for!

CON3 - 24 Pin (12 pin sides) card edge

connector, 156° spacing for connection to

the Commodore 64 User Port.

Printed Circuit Board and DTMF Decoder Kits

Printed Circuit Board Only - \$15

Complete DTMF Decoder Kit (Circuit

board, components, and CON1 & CON2) - \$28

Complete Kit + 24 Pin Card-Edge

Connector for C-64 or VIC-20 User Port

(CON3) + 5.25" Disk with number logging

software - \$42

Send orders, payable to:

Millennium Systems

P.O. Box 70363

San Jose, CA 95140

You can also send comments and feedback to this address. If you have an application you'd like to see added to the hacker's tool kit, send it in.

The Nynex Change Card

by Kevin Daniel

Nynex is currently testing a supplemental to coin-operated telephones in New York City based on a disposable card technology called the Change Card. This article represents an analysis of this system based on information inferred from the dissection of several cards, and tools

using the Landis and Gyr Type BTR1290-4 telephones installed in one of Nynex's test sites. Your mileage may vary.

The Change Card is a plastic card identical in size to a credit card which is dispensed from a vending machine, costs \$5.00, and has an initial value of \$5.25. As calls are made using the card, the telephone subtracts value from the card and the value remaining is displayed both on the phone and the card. Billed as freeing the customer from the burden of carrying a pocket full of loose change, I can imagine this system has a host of benefits for Nynex such as: reduced consumer fraud, reduced employee fraud, calls paid for up-front, and the transference of some billing operations from the central office to the individual telephones.

The Change Card is made from reflective infrared reader and electrical discharge writer technology. On the face of the card is a highly reflective metallic strip covered by a protective layer of white infrared-transparent ink. It is on this strip that all card validation and value information are encoded. Validation bits are encoded as a series of areas of high and low reflectivity in the left-most 2 centimeters of the stripe. Value information is encoded as the length of the high reflectivity area starting from the end of the validation section and extending to

the right-hand edge of the card. When a Change Card is first inserted into a telephone it is locked into place and scanned left-to-right by the phone's read/write head. If the validation fails the card is immediately ejected, otherwise the scan continues until it hits the next area of high reflectivity. A new card has a value stripe beginning at about 2.2 centimeters from the left hand edge and running 6 centimeters. Upon placing a call the phone will fire a spark across the write head converting the underlying area of high reflectivity to low and scarring the white protective layer displaying remaining value to the user. Value is removed immediately at the time of connection and then following each billing period until the call is terminated. The system protects against fraud by performing a read-after-write sequence. If the write has not occurred the phone automatically and immediately

terminates the call and ejects the card. The system also protects against card tampering/damaging by skipping over value bits which have been damaged or blown out of sequence, reducing the value of the card to that of the next readable value. Other anti-fraud measures implemented on the test site devices include: physical capture of the card during calls, separation of the handset from the signal path prior to connection, and the blocking of 900 number calls.

The Change Card system is simple but highly evolved tamper resistant technology that would seem to have few possible areas of compromise. Although currently only available in units of \$5.25, who knows what secrets the

HOW TO HACK HEALTH

by MuscleHead

To quasi-paraphrase the lovable vice prez running OCP in RoboCop, "Good hacking is where you find it." In this case, it's in a room of sweaty people wearing lycra. Most health clubs have aerobic equipment, and more often than not a stair machine is part of the collection. You can do more with these things than choose some workout routine and lie about your weight, you can hack them! They don't have that keypad and LED display just for the users, it's also there for techs and club owners to do things you (the sweating ones) aren't supposed to know about....

All of the following refers to a Stairmaster 4000; I've seen, but my place doesn't have, LifeStep systems. Presumably, there's good stuff locked away in its firmware as well.... All codes unless listed otherwise must be entered when the thing is in attract mode; you can tell if it is as there will be an EKG-like blip going across the display. ENT means the enter button on the keypad.

First, find out the revision, since the codes you will use will depend on this. Hit 107 ENT 4.

You should see something like this:
REV. D, REV. E, REV. M, REV. 1.1, REV. 1.2, REV. 1.3, REV. 1.5, REV. 2.1, or REV. 2.2.

If you get anything below 1.5, don't bother with it, most of the codes won't work.

Changing the workout time. Feel like you're not getting your fair shot on the stair? Hit 1010 ENT, enter the time (up to 45 minutes), and ENT again. Then, when Bobby Joe Stairoid wants you to get off, you can tell him "Hey, the thing hasn't beeped and you know they shut off after fifteen minutes..."

Locking in the maximum time. Use your knowledge to protest goofy time limits. Note: this really locks in the max time; some poor Stairmaster tech will

have to come out and use his/her magic wand if your club wants it changed after you do this. For 1.5 and 2.1 revisions:

1010 ENT, enter the maximum workout time, ENT, system goes back to attract mode, **97405 ENT**, system displays time you just set, ENT. For 2.2 revision:

1010 ENT, enter maximum workout time, ENT, system goes back to attract mode, **97405 ENT**. Now you can avoid the evil club's high-turnover setting and stay on the Stairmaster up to your God-given 45 minute limit!

Creating aesthetic commentary. This is the fun stuff. All those LEDs can be used for more than just displaying some simulated terrain or blipping a fake EKG; they can convey your deepest thoughts on the whole body image issue. Or a really devastating ego-nuke, depending on your mood. Your insightful commentary can be a max of 128 chars, including spaces, and will replace the normal EKG blip used in the attract mode. Each character is entered by using its 2 digit code; hitting the CLEAR button gets rid of an incorrect character. Here's the code table:

A=50	N=53	Space=76	*=22
B=51	O=64	0=00	\$=23
C=52	P=65	1=01	=24
D=53	Q=66	2=02	%=25
E=54	R=67	3=03	?=26
F=55	S=68	4=04	'=27
G=56	T=69	5=05	"=28
H=57	U=70	6=06	_=29
I=58	V=71	7=07	=30
J=59	W=72	8=08	heart=31
M=62	Z=75	*=21	

To program the message, hit 7607 ENT, enter your message, ENT. Remember, given the location, an ill-chosen message could push someone insecure with themselves into another five years of therapy. So, be a good neighbor....

Editing the message: 7607 ENT

brings up the message. Use the up/down arrows to scroll through the message. **CLEAR** kills the rightmost character on the display, and anything you enter is inserted at the right.

Shutting message off: **2123 ENT**. It's still stored in memory though.

Turning message on: **2121 ENT**.

Turning "teletype" sound on: 40 ENT.

ENT. Slot machine: this replaces the standard "You didn't die!" message you get when you slave all the way through a session. Not nearly as much fun as the message option, but it can cause amusing confusion in workout-number victims. **8089 ENT**, "DISPLAY ODDS" is displayed, enter number between 5 and 9999 depending on how unlucky you want everyone to be (higher is unluckier). **ENT**. Not too thrilling.

Turn off slot machine: **8089 ENT**, 0, ENT.

Cover your ass: **105 ENT**. This wipes

the memory, and any chances a club owner has of proving you have curiosity. Miscellaneous stuff: (all codes followed by ENT)

3121: Display current slot machine odds.

7703: Cumulative hours and floors.

9760: Change over to Imperial system.

9761: Change to metric system.

107 ENT 5: Displays settings.

As an alternative to health clubs, many health equipment stores now carry higher-end toys like Stairmasters.

Many of these stores also display them prominently at the front windows because "Hey! LEDs!" - Joe Customer will always be hooked by a lightshow!

So, what better place to get across your opinion than a trendy health equipment store at a busy mall? Celebrate your public debut with a corn dog at Frank's Crisco Haus while you watch the nice owners handle the extra business you brought in....

For nearly two years, the 2600 Voice BBS has brought people from all walks of life together in a spirit of cooperation and sharing. While it might sound nauseating, it really can be fun. By dialing (10288) 0700-751-2600 you will become part of a vocal band of explorers, their quest - to search the earth for strange phone numbers, their goal - to share tales of hacker adventure, their desire - to help others figure out the answer, and their purpose - to achieve all four.

BUT ALL OF THAT IS ABOUT TO

SOFTWARE PIRACY

Another View

by Roberto Verzola

Reprinted from the World Press Review, courtesy of the Third World Network Features agency of Penang, Malaysia.

Many Manila computer users copy programs from computer shops or from the computer bulletin board systems that have proliferated around the city. They give copies of these programs to friends and colleagues who, in turn, give copies to other friends and colleagues. In the terminology of Western software companies, they are pirates. Copying commercial software and giving it away to friends and colleagues is called piracy.

I have seen pirates in movies, and they are a mean bunch. They are villains who steal, kill, and plunder. At the movies' endings, when these good-for-nothing pirates get their just due, the audiences invariably applaud, for the pirates get the punishment they roundly deserve.

It is no fun to be called a pirate. Or to be treated like one.

I have seen a number of people who come from or work for Western software firms. They come and visit this country of pirates and perhaps make a little study of how much they are losing from piracy in the Philippines. Quite a number of them, I would say, come to the country to do some pirating themselves. However, they do not pirate software. They pirate people. They pirate those who write the software. They pirate our best systems analysts, our best engineers, our best programmers, and our best computer operators.

There is quite a difference between

pirating intellectual property and pirating individuals. It costs our country perhaps \$10,000 to train one doctor. Training a second doctor would cost another \$10,000.

Training 10 doctors would cost \$100,000. In short, given an "original" doctor, it would cost us as much to make each "copy" of the original.

When the Americans pirate our doctors, they take away an irreplaceable resource, for it takes more than 10 years to train a new doctor. The Philippines has approximately one doctor for every 6,700 citizens. When the U.S. pirates this doctor,

it denies 6,700 Filipinos the services of a

doctor. And every year, the U.S. takes

away hundreds of our doctors. How many Filipinos have died because they could not

get the services of a doctor in time?

What about a computer program?

Whatever amount Lotus Corp. spent in

developing its spreadsheet program, it

costs practically nothing to make a second

or third copy of it. When Filipinos pirate

the program, they have not stolen any

irreplaceable resources, nor would it take

Lotus 10 years to replace the program, nor

have we denied any American citizen the

use of the program. It is still there for

Americans to use. When the U.S. pirates

our doctors, it does not take a copy and

leave the original behind. Instead, it takes

the original and leaves nothing behind.

Copying software is a benign case of

piracy. Pirating doctors is a malignant

case. We have been victims of this

malignant form of piracy by Western

countries for a long time. They should be

the last to complain when they are affected

by a benign one. This piracy debate will

become even more important in the future,

because advanced countries are now

developing computer programs that can

incentives and enticements, these

intellectuals have their own reasons for

copyright or patent laws of a country,

but this would normally be different

from the crime of theft or actual piracy.

Using these words, however,

automatically connotes immoral action

on the part of the copier. Thus, in the

polemics against the Third World,

"piracy" and "theft" are favorite terms

among advanced countries, particularly

the U.S.

The term "piracy of intellectuals" can

nwisely be used, if one wants to ascribe

a sense of immorality to the act. This is

not to imply, of course, that countries

own their intellectuals. Both

intellectuals and intellectual property

have other important attributes, aside

from simply being commodities on the

market. Notwithstanding the fact that

his apostles had only five loaves of

bread and two pieces of fish to feed

5,000 people. Every time I give away a

copy of my favorite program, I

remember the miracle of the loaves.

Indeed, how can you be selfish if you

can give things away and have more

than what you started with? How can we

deny a good friend if we can also keep it

for ourselves?

YOU'LL NEVER CATCH 2600 RESORTING TO CHEAP GIMMICKS LIKE MULTI-PAGE ADS.

We prefer to devote our pages to the DIFFERENT projects that are ongoing. For those of you on the net, there are now two outlets to vent your hacker fervor.

On the 26th of each month, hackers from around the world converge on Internet Relay Chat Channel "#2600". If you're on the net, ask your system admin how you can access irc. If (s)he sputters and turns red, you will be able to easily identify them as a "hardass sysadmin" with no sense of fun.

Ongoing on the net is a newsgroup called "alt.2600" where hacker issues of the day are discussed from around the world. If you're still on speaking terms with your system admin, ask them how you can subscribe to this newsgroup. If they begin to converse and speak in tongues, it may be time to consider another site.

"theft" of intellectual property are emotionally laden, but they are not very accurate descriptions of the act. Legally, one might be charged with violating the copyright or patent laws of a country, but this would normally be different from the crime of theft or actual piracy.

Using these words, however, automatically connotes immoral action on the part of the copier. Thus, in the polemics against the Third World, "piracy" and "theft" are favorite terms among advanced countries, particularly

the U.S.

In the best brains of the Third World to work for them through various incentives and enticements, these

intellectuals have their own reasons for doing so. Perhaps the chances for personal and professional advancement are better. Perhaps the environment is more conducive to their own temperaments and predispositions. Perhaps they were persecuted in their home countries, and so on.

The Christian Bible tells of the

miracle of the loaves, when Jesus and

his apostles had only five loaves of

bread and two pieces of fish to feed

5,000 people. Every time I give away a

copy of my favorite program, I

remember the miracle of the loaves.

Indeed, how can you be selfish if you

can give things away and have more

than what you started with? How can we

deny a good friend if we can also keep it

for ourselves?

Coping with cable denial

by Cap'n Dave

There are three forms of denial technology in common use today. The first is the simplest: the negative trap. This is merely a filter placed outside of the home (usually on a pole, inside a pedestal, or in a box mounted to the house) that blocks out certain channels. The problems with this system are that a capital outlay is required for the homes that don't pay for the premium channels, and that someone has to come out to add or remove services. In addition, a converter may be required for non-cable-ready equipment.

These negative traps are cylindrical in shape, about five inches long and one inch in diameter. They are threaded with a male "F" connector on one end and a female "F" on the other. Each one may block out one or more channels (always contiguous though), and are often used in series. On channels where these are in use, your TV will show nothing, or a faint, "snowy" picture.

These could be removed, but the cable company will eventually notice and possibly get upset. Better yet, older-style traps can be opened and wired straight through. If they were then replaced, the cable company might never notice. A clever person might steal someone else's traps to experiment with. Never traps are filled with epoxy and will have to be drilled out before being re-wired. The experimenter will probably have to destroy a few of these to get the technique down.

A note for apartment dwellers: the traps for every unit in the building are usually in a box somewhere on the outside of the building. This may (or may not) have a lock on it. In any case, the next time the cable company comes out there is a small but finite chance that they will notice all the traps missing on one particular unit. To avoid this, drill out and rewire the traps, or remove every single trap in the box. Better yet, share the joy with some other buildings. This won't work for long, but it covers your tracks.

In the old days, the negative traps could be "burned out" by attaching 120V AC to the cable, and snapping it on and off a few times. Do not do this! It won't work anymore (the traps burn out and no longer pass signal) and it's real obvious to the cable company what happened. Mashing co-ax is hard to hide. Also,

it sometimes catches on fire. Kinda hard to explain to your insurance agent and/or the fire department.

The second common denial method is the "interfering carrier". In these systems, a "tampering" carrier is placed halfway between the video and audio carriers (at a frequency 2.25 MHz above the video). This is removed by a "positive" trap placed inside the paying customer's home (threaded in fire on the back of the box/CATV). They look just like a negative trap, described above. In this case, the cable company only has to shell out for customers who are paying for the service. However, the interfering carrier obliterates some of the picture information, and the filter blocks out even more. This results in some degradation of the picture, especially the sharp details. Cable companies often get complaints about this.

These channels (more than one denial method may be in use on the same system) can be identified by the loud screeching noise emitted from the TV. Also, the picture should be fast-moving and/or full of lines. The actual jamming effects may vary from TV to TV. An article in the Spring 1993 issue described a crude method for blocking an interfering carrier. I have not tried this, and have no idea how well this will work.

The third method is to scramble the picture, and lease the customer a converter-descrambler to recover the picture. Not all converters can descramble. And one brand is not likely to descramble the competition's scrambling scheme. Also, unlike an earlier writer indicated, not all brands of converters have "booty traps" in them that activate on opening. Some do (especially Pioneer), but probably far less than half of non-Pioneer boxes are so equipped. If one were to "accidentally" trigger one of these, it would be prudent to return it and say the cat knocked it off the top of the TV. As long as there are no other anti-tamper methods in use (labels, etc), this will probably work. Especially if a female swapped the box. Women virtually never pirate cable. It's a man's game.

Scrambling is done in several ways. The most popular is to amplify the voltage of the horizontal sync signal. This prevents the TV from knowing when to draw the electron beam

back to the left side of the screen. Thus the picture "breaks up". Usually the audio is undistorted. The cable descrambler lowers the voltage of the sync signal, and the TV again looks.

Now, about converters. These boxes come in three flavors: non-addressable non-descrambling, non-addressable descrambling, and addressable non-descrambling. The non-addressable non-descrambling converter is just a converter - it turns the channels that non-cable-ready equipment can't tune, and converts them to channel 3.

The non-addressable descrambling

converters can de-scramble and tune channels. But they must be programmed by the cable company via some contact method (i.e., not through the cable). They may have to open the box and program a chip, or use an infrared programming scheme.

This most sophisticated (and newest) form of converter-descrambler is addressable. That

is, the cable company can reprogram the box over the cable. They will die, at least temporarily, if cut off from the data on the cable. These are the only kind of boxes used for pay-per-view.

Contrary to popular opinion, these boxes do not "spy" on the customer. They don't have tiny cameras or microphones in them. Cable operators have enough trouble getting a signal to you to worry about that sort of thing. In fact, the vast majority of cable systems are one way only, or at least one way over the cable. This means that the company has no way to tell if a box is cloned. On systems with instant pay-per-view (where the movie is bought from the box, not over the telephone) there are two ways of getting the data back to the cable company. Phone return is the cheapest. The box is attached to the phone line and it calls in, usually in the middle of the night. The more advanced systems send the data back over the cable. This system is gaining popularity as the phone companies try to move into the cable business, and as they try to make the cable companies pay for using the phone lines. Both of these schemes are sometimes used to monitor what people are watching (it's more like asking the box, "See what they are watching tonight at 7:00 PM and call me back." The cable operators can't find out every time you switch channels.)

The costs of those converters vary from \$60 to \$100 for the simplest up to \$150 for a top-of-the-line addressable unit. "Wide open" units may often be purchased on the black market. Check the ads in the back of Popular Science or Nuts & Volts. (You do subscribe, don't you? All hackers should. Call 1-800-788-4624 now.) These are also good sources for replacement remotes, in case you lose yours. Remotes cost the cable company about \$5 but they often charge \$50 if you lose one. In addition to charging a couple of bucks a month. Talk about your return on investment!

Remember, though, that it is illegal to own a

converter box capable of receiving service to

which you are not entitled.

Some "legitimate" cable companies are

actually Marks-owned fronts for obtaining converters. Stores constantly circulate about systems with 2,000 customers ordering tens of thousands of boxes. These converters are then diverted into the black market. With the government raiding these shops, it may or may not still be safe to order boxes, though remotes are probably still OK.

Positive traps can also be purchased from some of these suppliers, or can be built using parts from Radio Shack. Build a high order notch reject filter, and tune it for best picture quality. If there are several channels on the system blocked by an interfering carrier, a clever person might build and optimize (or buy) a single filter for channel 3 and use an inexpensive non-addressable converter to put the video out on channel 3.

Most converters can be opened easily, even though they often have some sort of "security" screws on them. The nastiest one I've seen uses a head that is slightly oval. You will know what I mean if you see one. These can be removed by heating a plastic tube and pressing it down over the head before it cools. Now you have a tool! Pens make good sources for such plastic tubes. Other kinds of security screws can be removed with improvised tools, or vis-a-grip pliers. Tools have also been advertised in Nuts & Volts.

Cable TV companies do have the ability to "lock" down the cable and see what equipment is attached, and what channel you are watching. However, this requires skilled operators and expensive equipment (high frequency spectrum analyzers and TDR units). It must be done at the house (or pedestal pole, etc.) and is not usually done randomly. This snooping can meet likely be blocked by putting an amplifier before anything you don't want them to see. They will see the amp, and nothing past it. Higher quality amplifiers will do a better job.

Happy hacking!

OKI Telecom

(404) 995-9800

(800) 554-3112

Review by Mr. Upsetter

Any technology that combines radio, telephones, and computers is sure to interest hackers. It's no wonder cellular telephony has received so much attention. Now exploring the system is a little easier for us. A company called Network Wizards has introduced an interface that allows control of an OKI 900 cellular telephone from a DOS PC via the RS-232 port. Their Cellular Telephone Experimenters Kit (CTEK) consists of an interface, four DOS executables for controlling the phone, and a C function library so you can write your own programs. Also included on disk are a user's manual, function library manual, and a short cellular tutorial.

The interface itself is contained in a small black box with a DB25 connector on one end. A cable with a specialized plug for connecting to the OKI is on the other end. Inside is a PIC16C54 microcontroller which converts data from the OKI to standard RS-232 data. The interface also has a mini stereo jack for connecting a microphone and earphone.

The DOS executables included with the CTEK allow you to perform numerous functions. The MENU EXE program allows you to change any of the phone's five NAMs (A NAM, or Number Assignment Module, consists of a telephone number, system ID, initial paging channel, access overload class, and group ID mask. This information, along with the ESN, identifies your phone in the cellular system.) This program also allows you to read, write, and edit the phone's 200 alphanumeric memories. The TEST EXE program allows you to manually control the transmit and audio functions of the phone. You

can turn the transmitter on or off and set the channel, SAT, and transmit power. You can also set the volume, mute the transmit, or receive audio as well as set the audio source to the earpiece, speaker, or external jack on the CTEK interface. The TEL.EXE program allows you to monitor the paging channel and displays all the forward control channel messages. It also allows you to place and receive a phone call while displaying the voice channel messages.

The KEYCON.EXE program simply allows you to press keys on the OKI from the computer keyboard.

The programs provided with the CTEK certainly expand the functionality of the phone. But to do the really fun stuff, you need to write your own programs. Source code to TEL.EXE and KEYCON.EXE are provided to get you started with the CTEK function library. Although my C programming skills were a little rusty, I found it easy enough to write programs with the library. I wrote a cellular scanning program which had the following capabilities:

Scan for a paging channel and display the messages. If a voice channel is assigned, go to that channel and listen to the call. Scan voice channels and listen to active channels.

Scan OMNICELL channels and listen to active channels.

While listening to a call, display the voice channel message.

Automatically follow handoff.

Decode DTMF, change the volume or audio source.

Automatically mute the audio and stop monitoring when the call is released.

Other functions in the library allow you to send reverse channel messages, get the received signal strength, control transmitter and audio functions, and read the phone's memory. Overall the function library is quite versatile. I had several other ideas for programs, for instance:

Log all messages and call information for certain cellular phone numbers. You could log paging channel messages, calls placed and received, call durations, DTMF digits dialed, cell channels used, etc.

Create a "spectrum" display of the cellular band by scanning all channels and recording the signal strength.

With a map of cell sites in your area, physically track a phone as it moves from cell to cell.

I had great fun exploring the cellular network while playing with the CTEK. But this kit isn't for everyone. To get the most out of the CTEK, you need to write your own programs. The executables provided in the kit really don't use the phone to its highest potential. Also, the OKI 900 isn't the cheapest phone in the world. It goes for about \$450 to \$450 new, perhaps \$300 used if you can find one. Still, you could put together a great cellular monitoring system comparable to the ones designed for law enforcement for a few hundred dollars as opposed to a few thousand dollars. The CTEK is best suited for monitoring the cellular network rather than as a tool for fraud. You cannot change the phone's ESN with the CTEK. In fact, the library function which lets you send reverse control channel messages won't even let you send a bogus ESN.

Overall, the CTEK is a well designed product, both in hardware and software. While it's currently only available for the OKI 900, Network Wizards promises a version for the OKI 1150 soon.

Sample output of my cellular monitoring program (phone numbers have been masked)

Monitor system A or B?

Monitoring system B

Scanning for control channel

Monitoring Control Channel: 0337 System: B

Received Signal Strength: 46

DID YOU MOVE? ARE YOU EVEN THINKING OF MOVING?

Let us know several weeks in advance. For some reason the post office doesn't forward magazines so you might miss an issue if you don't let us know about your new address. Also, to make sure it's

actually you changing your address and not some mischief maker, we ask that you include your address label with any correspondence. If you can't find that information, then use an official address change card from the post office. Please don't leave address changes on our answering machine or through email without label info.

Decoding DTMF. Press any key to resume.

FoIA facts and fiction

by GailDancer and Shrike

Congress created the Freedom of Information Act and its sister, the Privacy Act, to guarantee citizens access to government files of interest or concern to them. This act is a law! That is supposed to be readily accessible. Sounds good on paper, but as we all know, some government agency closures seem to have a really different point of view. Because of those mindsets, and the games that go with them, you need to know exactly how to submit your request.

The FOIA is intended to apply to any government agency. It does not apply to Congress, Federal courts, or the Executive office. There are also exemptions for Uncle Sam's banks and corporations held by the U.S. government. While the act is worded to provide access to agency records, this term is not really defined within the body of the law. The statute has, however, defined this to mean documents of other information bearing materials such as photographs and computer tapes, within both the possession and control of that agency. Any U.S. citizen, permanent resident aliens, foreigners, corporations, unincorporated associations, etc. (you get the picture) can make the request.

The Act requires an agency to respond within ten working days. If you're not happy with what you get, you can make an administrative appeal to which they have 20 days to answer. In all cases, there's a Catch-22 where they can claim a need to get files from field offices, etc. But basically you should have some sort of response within a month in six weeks. There are a few instances where they can deny the request completely, but these are things like national defense or security, agency personnel, trade secrets, oil well locations, and the like, where it may interfere with law enforcement in an ongoing investigation. Sometimes they will try this load of malarkey on you. But just remember that it's a poor marking that denial and exemptions are discretionary, not mandatory. You will usually get what you want with an appeal. Then a supervisor has to look at the matter and they usually give up the goods. Also they cannot just claim that the information fails under some sort of exemption. They must state exactly why!

Now what about this cost? Well, the Act provides for a small fee to be charged for direct costs. That's copying folks, not the man hours involved in tracking this stuff down. There are sometimes search fees, but they are pretty insignificant. Whatever this "search" line is, it isn't I main seems. There's even a provision where these fees can be waived if it's in the public's best interest, but let's face it, they see mod enough us getting the request, so don't expect them to waive the fees unless you can get pretty creative with words and make them believe it's in the public interest!

Now let's get down to business and make the

request. At first glance everyone may think the "easy

ball" perhaps since we have more colorful backgrounds than others and want to target more than just one agency or branch office. The United States Government Organization Manual is probably at your local library. If not, call your local Congressional Representative. His office should help one get to you. (It's a nice way to make sure they are earning their paychecks!) Once you have targeted who you want to ask, then give their local office a call and get the address for FOIA requests. If you're paranoid, make the call from a payphone. But the simple fact is they just don't have the manpower to investigate you just because of the call.

Again, the Act is vague about the request, saying that you must reasonably describe any records being sought. This only means that they won't info so that an employee of that agency who is familiar with their filing system can locate the records with a minimum of time and effort. You do not have to explain why you want the information. Don't let them tell you that you do! But keep in mind that the more precise and accurate the request, the more likely you are to get a complete response (unless they just try to shove you on the Secret Service is doing with the Detroiter City Hall trip). You should try to follow a basic request strategy:

Limit your request to what you really want. Don't just say "all files relating to..." or you are giving them an excuse to delay or sock you with copy costs. State what your request includes and what it doesn't include.

Be specific about the search terms; use "and/or" to cover all the bases and not give them an excuse to manipulate your request. Decide if you want to write to a regional office or the central one. Recent local investigations would probably be held in a local office.

If you know there have been newspaper accounts, check those out. These Government geeks can be pretty thorough and so should you. Include dates and locations, as well as the names of specific focus (officers, agents, whatever) if you know them.

If you are asking about yourself, then make sure you give as much identifying data as possible, i.e. Social Security number, driver's license number, date of birth, place of birth, etc.

Now anyone can write a letter. And many people do. Not that they get what they want. But with a little effort, you will submit a masterpiece that will motivate them rather than allow them to ignore you. By all means type it. Use a copy. Give one statute: Freedom of Information Act, 5 U.S.C., section 552. If you are asking for personal files on you, also cite the Privacy Act, 5 U.S.C., section 552a. It's good to begin

your letter with those cited. Toward the end, remind them that you know your rights. Nicely. Let 'em know that if their response is not satisfactory, you will be appealing and ask that they include their name and the name of the person appeals should be directed to.

You see, requesting personal files, you will need to get with most of the text blocked out, that's just one of their BS strategies and you should appeal. Appeals get you further than you think. Also, if you do not get an answer try this: once you think you should, then write again or call to let them know that you feel they are violating the time limit set forth by law.

They may claim that materials do not exist when in fact you know they do. True, they may just be manipulating your request. Decide if you want to write to a regional office or the central one. Recent local investigations would probably be held in a local office.

If you know there have been newspaper accounts, check those out. These Government geeks can be pretty thorough and so should you. Include dates and locations, as well as the names of specific focus (officers, agents, whatever) if you know them.

If you are asking about yourself, then make sure you give as much identifying data as possible, i.e. Social Security number, driver's license number, date of birth, place of birth, etc.

Now anyone can write a letter. And many people do. Not that they get what they want. But with a little effort, you will submit a masterpiece that will motivate them rather than allow them to ignore you. By all means type it. Use a copy. Give one statute: Freedom of Information Act, 5 U.S.C., section 552. If you are asking for personal files on you, also cite the Privacy Act, 5 U.S.C., section 552a. It's good to begin

playing 200, but most often they are so disorganized that you will need to be extra specific than you already have been. Some of these geeks get so misfiring of each other that they carry on their own�� for FBI field offices as well.

If you are still running into trouble, then write your district Congressman or Senator representative. There are even a couple of Congressional committees responsible for overseeing the bowel workings of the FOIA.

For more information, sample forms, and lots of help addresses, there is a book called "Using The Freedom Of Information Act - A Step By Step Guide" available from the Center For National Security Studies, 112 Maryland Ave., Washington DC 20002 for only \$2. They have some other privacy informative books as well on nuclear security and surveillance.

Happy hunting!

LETTERBOX

Comments

Dear 2600:

As an avid reader who uses 2600 mainly as a tool to improve corporate security, I thought I would comment on a few items found in your Winter 1993-94 issue.

Concerning lone operator equipment, there are other "services" which use scores to activate equipment, etc. Living near a nuclear power plant, one of the jobs is the monthly stress test. One day I had planned to be listening to the siren at the test site were taking place and, to seal myself off, I had the local law enforcement agency was broadcasting some tone groups which seemed to coincide with the sounding of the sirens. A trip to the local police department (the test site) revealed a box on the radio room wall, labeled accordingly, with test and reset buttons on the front. When the test began, each test button was pressed in sequence, followed minutes later by each reset button being pressed. Why someone had recorded these tones and maliciously set off the sirens is beyond me...

Concerning payware procurement, one of our pastimes in college was taking advantage of beginning computer science students by writing a CICS workstation to simulate a long screen, and running it on one of the terminals in the computer lab. The students would attempt to log-on and, when they did not succeed, would figure the terminal was dead and try another. Little did they know we were reading their ID and password for later use. Of course, we ran our little "revenge" rancid from time to time, so the lab assistant's accounts to admit suspicion in the unlikely event anyone ever caught on.

Even telephone service providers are not beyond using fraud to rape their customers. Several years back, when shortwave long distance providers began to offer these services, little boxes with pads of rate tickets began appearing in restaurants offering a free drink or some other expensive item for merely filling out a free entry form. Unfortunately, hidden in the fine print was a statement authorizing the change of your long distance service to brand XX. It was really a shock to get your phone bill and notice a new long distance provider. The upside was that after complaining to Baby Bell and getting the service switched back to the old provider, AT&T, we were treated as a "new" long distance customer and given a \$5 gift certificate. Along this same line, I heard of a lady who filled out one of these traffic tickets using her work address and phone number. Supposedly, it took the company big blocks to switch back to their normal carrier, and it cost the lady her job.

Another thing we discovered in our adventures with the IBM mainframe computers in college was the coupon queen. Few chose unfamiliar, all printing jobs go into temporary storage, where they are routed to their respective printers or other servers as they become available. One of the areas which was faster than waiting

for a printout, was to have the job printed to the screen.

This gave the programmer immediate access to the program error listing and output. Supposedly there is an operator running batch jobs and monitoring the computer system for various events such as programs stuck in readers loops - a big job with beginning students on the system. Usually the operator is away from the terminal and is not aware of a problem until someone calls in. The trick is to write a program (or convince a beginning student to do it) which will type out printer pages upon pages of output. Not wanting as waste paper, the output is directed to the user's terminal. Unless the operator catches the problem, the job keeps on running. Suddenly the system begins to slow down and finally stops processing. There is suddenly no place for any output to go as the loop program has generated thousands of pages of output, filling the output queue. I am not exaggerating the amount of output either! Our hotdog lab assistant wrote some test code which generated 12,000 pages of 15 column output before the system crashed and died.

Big Wind

Hacker Understanding

Dear 2600:

I just finished up your Winter 1993-94 issue. I love the books my local bookstores click give me whenever I buy it, and I must commend you upon another fine class effort. I just came into contact with a hacker to the monikers in my area, which are always exciting. Of course, since I started going to them, I have become known as a weirdo who goes to hacker meetings by my normal friends. They always say "hacker" so if they are literally spouting out the word. Ah, well, if we were all made to suffer fools gladly, why did they invent mental institutions?

Your journal is one of the magazines I most look forward to and the best thing to ever happen to the Hipp community. What always amazes me is how most of those who are coming into the fold now are only 16 to 18 years old. I think it's great that they are getting into the game, but phone calls and get passed letters, there seems to be very little desire to learn any more. That is one of the things that makes your magazine refreshing.

Spoofster

Nynex Negativity

Dear 2600:

I recently moved to the 10009 section of 212 and ordered Nynex Voice Mail (so I could access my messages from a PBX system at work). This outrageous system charges for monthly use and for both touch call and make to access your messages and each incoming call you get. The caller leaving you a message also pays for a call, so I see it as charging twice for each incoming call.

There are lots of us who are in debt to them and avoid our knowledge. As we all know, there are hole punchers that can't tell a difference between a new and old card. I heard of a lady who filled out one of these traffic tickets using her work address and phone number. Supposedly, it took the company big blocks to switch back to their normal carrier, and it cost the lady her job.

Another thing we discovered in our adventures with the IBM mainframe computers in college was the coupon queen. Few chose unfamiliar, all printing jobs go into temporary storage, where they are routed to their respective printers or other servers as they become available. One of the areas which was faster than waiting

that the system does not tell you if you are using a valid user ID or not, but if you look a little more closely at how the system moves to the user IDs you type in, you may find what you are looking for. The network I use runs Netware 4.0. All the stations are 486's. Most of the users in this system have three digit (alphanumeric) user IDs.

The effect are Supervisor, Guest, etc. Anyway, let's say I try to login testing my user ID that I know is valid but I enter my password wrong on purpose. What happens? The software checks to see if my user ID is valid. This takes only a second. Next, it checks my password. This takes more time because the program must access the binary files and search for my user ID and password.

Since I entered the wrong password, the system kicks me out with a nicely "Access Denied, re-enter" message. Now if you look at how much time the system takes to kick you out, then you have the key to finding valid user IDs. My user ID was valid, so when I entered the wrong password it took about four seconds to lock up my correct password, determine the one I entered was wrong, and exit. Had the user ID been incorrect, Novell would have kicked me out almost instantly. Try it. You can write a simple program in BASIC that will try all letter and number combinations by saving the user ID you wish to use and a stupid password like "asd" to a file, then starting the login program with a line like "LOGIN&PFILENAME.XXX". Time how long it takes for the program to return. It takes a long time to return, then chances are you've got a live one. If not, then the user ID is not valid and the program should return almost instantly. Be sure you include a line to log off the network in the event you find a user ID that is not password protected. You will be surprised how many you find. I can't claim this will work on all networks, but it sure has worked on mine.

Digital Enigma
Cotatiwood, CA

Questions

Dear 2600:

E is the algorithm for figuring the last digit of a credit card account number discussed in a back issue of 2600? I'd like to know which one? Also, are you still selling a list of Mastercard and Visa numbers that identify the issuer?

BO
Coelands Manor, NY

We have a list of Mastercard EINs (Bank Identification Numbers) that we offer for \$3. However, this list is practically three years old. We recommend scaling and we put our hands on a new one. We never did for a Visa list. As for the credit card algorithm, we do the same year in our autumn 1992 issue. It's really quite simple so we'll explain it here. On cards with an even number of digits, double the odd digits (first, third, fifth, etc.). If doubling the digits brings the digit over 10, then subtract 9. Add all of the digits up and the sum should be divisible by 10. On cards with an odd number of digits, do the same above, except, ignore double the second, fourth, etc. digit instead of the odd ones. If this comes up all different or something, you just need to practice a few times with a valid card.

Dear 2600:

This mail is in reference to an old 2600 article that

describes the steps. As long as people don't buy into their pricing scheme by using this service, it will either go down or come way down in price. The ball is sitting in our court.

Reader Abuse

Dear 2600:

This letter is in response to the letter titled "Bookstore Trouble" in the Autumn issue. I think another reason why this publication might not sell well is because bookstores hate it. I get my 2600 from a local Barnes and Noble. I asked them if they subscribed to this magazine. The person in charge said "I don't know," and "we don't have our magazines listed so I can't find out." I stopped back and pretended to be looking at another book at this store. After I left, a man came up to her and asked if they had another magazine. She pulled out a list and told him "yes" and where to find it. It was pure luck that I found 2600. There were at least ten of them stacked in a rack where I had to feel around to get one. I complained to an employee about the location of 2600 but the next time I came in they were in the same place.

I am interested in test loop numbers for the 2600 series. Does anyone know any?

Guy At The Desk
Symp At The Office EBS
(209) 474-8829

Please let us know the exact server and location of any stores that fail to respond to display our belief after publication. It would be interesting to find out very many as in the first place. Regarding loop numbers, if they all exist out there, they would probably be hidden somewhere in the 2600 catalog.

Dear 2600:

E is the algorithm for figuring the last digit of a credit card account number discussed in a back issue of 2600? No, which one? Also, are you still selling a list of Mastercard and Visa numbers that identify the issuer?

We have a list of Mastercard EINs (Bank Identification Numbers) that we offer for \$3. However, this list is practically three years old. We recommend scaling and we put our hands on a new one. If this comes up all different or something, you just need to practice a few times with a valid card.

Dear 2600:

This mail is in reference to an old 2600 article that

had a 101-digit sequence that could be used to randomly access an answering machine. I have a question about access codes for two and three digit remote access answering machines. Assuming that we are dealing with a "semi-smart answering machine", one that listens to only consecutive numbers yet doesn't hang up after two wrong digits, the 101-digit string is necessary to guess a two digit code. Is there a formula that can be used to come up with this segment? And if so what would be the formula to generate a sequence to access an answering machine with a three digit code?

When we get it, we'll print it. We promise.

Dear 2600:

Has anyone figured out a way to track those automatic car washes at gas stations, where you enter a code? It would be nice to be able to wash the car daily...

There are just so many things to track these days...

The Dark Side

Dear 2600:

I read your publication for only one reason - to try and keep up with the enemy. I am responsible for a number of large PBX's, many with voice mail systems. One of my biggest problems is keeping irresponsible, hooliganistic and vicious out of my business. You publish an article that those who want to know have a right to know. I don't disagree that until they start picking accidents is my voice mail system (or anyone else's) often with less than honorable intentions and do damage or steal from me. They may have a right to know, but they have no right to explore my system or use it for anything other than what I want it used for.

We spend time and money securing our systems. Businesses we would like to use are turned off because a thief might discover them and could potentially steal from us at the cost of thousands of dollars, in hours. I would rather have my businesses being productive work...

In your last issue, you put the name Ed from Puerto Rico in his place because it is obvious he only had racism on his mind. Unfortunately, this same Ed is going to be educated in how to achieve his objective by your publication. You simple (and implicitly endorse) your notion that it can be done and gotten away with. Many of the articles you publish are reports of crimes committed and how it was done by the perpetrator in enough detail to repeat the act, yet simply information about how to get behind the locked door. Often you cross over the line to the side of irresponsibility.

Thanks for listening. I am sure if you publish this letter, thieves and losers everywhere will discover they offend me (and others) and stop doing what they do. I won't have to waste time securing my systems. The world will be saved.

Pissed Off In Houston

While we understand your frustration, we feel compelled to suggest that you seek another line of work. If staying your customer is a waste of time to you, you're not doing anybody any favors. The lesson you can't seem to

those features you want to use is because they're being frustrated with gaping holes you could drive a bus through.

Be glad you haven't suffered victim to these and fee enormous failing schemes the phone companies play on their customers.

We print facts on telecommunications and vulnerability. It's what we've been doing since the start and we're now about to cut off the information flow because information can be misused & would be a very sorry provider to tell the government we print can be used by mean people to prevent their hearing victims. Unfortunately, too many people think ignoring what we say or keeping us from saying it will make everything disappear go away.

The Far Side

Dear 2600:

A pattern of events has occurred that I feel have continued for too long. I would like to mention at the outset that while I agree in principle with some of your beliefs, I disagree with the methodology in which you carry out most of these beliefs. Notably it is not my concern how others run their lives but when their actions have an impact on my life I must take corrective action.

Over a year ago I was reminded that you were still publishing 2600 when I caught a broadcast of WBAL. On that show you mentioned a computerized CNA telephone number. You said on the air that the telephone number would appear in the next issue of 2600. I sent 2600 a U.S. postal money order, my return address and a note pointed out my latest printed in which I requested that my subscription begin with the above mentioned issue. I used a laser printer and a very legible font to avoid confusion from my handwriting. The issue with the CNA information is never arrived and my subscription started several months later with naturally a different issue. After several more months I wrote to you in 2600 issue #200 to express my desire to request your help. I never received so much as a postcard reply, any help or the missing issue. I did however receive three of the four issues of 2600 where the last two issues remained me to pay up for next year. Of the three issues that did arrive, two were so badly mangled that they were almost unreadable. While I am aware that the responsibility for this mangled issue can be attributed to our wonderful postal service, I want to point out that other magazines regular mail issues when notified. 2600 never did. The fourth issue never arrived. I tried calling your offices and was told it was due to the backlog in the mail room. While I am not satisfied with the exorbitant rates you charge, I am even less pleased by the disastrous manipulation by 2600. I prefer to 2600 leaving a very lengthy outgoing message on its answering machine.

Obviously this was done to be informative and helpful to the caller while in reality encouraging the caller to become a party to your scheme to defraud the telephone company in not paying for the incurred overtime charges. All the while maintaining its "plausible credibility". I wonder how many pay telephones have been removed from service and lines made more difficult because of such behavior? I know the alternatives are to: 1) pay the bill or 2) sweep the impossible and try to leave a coherent yet highly compact message in the microscopic time you have left available before the Nynex overline message activates. Writing to you is pointless and only serves to litter the streets after you have discarded this letter. No mention or provision is ever made on the 2600 outgoing message about when an actual human being is present and your answering machine is not answering your calls.

The final action that I resented me was that subscriber money was used to essentially pay for the editor's personal vacation to Holland thirty disguised as a reporter on a fast finding trip. This is as shady as satanic as those you describe on the radio. But this last fact is a matter of definability and perspective. If the point of view is that of a taxpayer, then illegal payments from tax revenue are reprehensible. If the point of view is taken from the recipient of the same projects then it's a job "pork". The usual argument made to defend such a decision is that "the peck" is being taken "for the greater good". What's next, getting Ed McMahon's picture on a 2600 subscription gimmick?

In short, 2600 has taken on the tactics of the corporation it professes to fight. Ultimately, I have decided to fight fire with fire and take up your baton. I've decided to vote with my dollars and, I will renew my subscription to 2600 (yes, I know you are disappointed). I'd like to you my Walkman whenever I can free of charge on WBAL and not subscribe to them either. A copy of this letter will end up there; there all there's nothing like using a little pressure from both ends, as you know. (I encourage others to follow my example.) I'll sell them of my experiences. To ease you decide to read this on your stereo or to publish it in 2600, I suggest you do so in its entirety and comment if you feel so moved when you have presented the facts as fairly as you are able.

Please note that I am purposely omitting my return address to avoid any further complications.

One very disgruntled former subscriber

Let's start by addressing your subscription problem. Since the time you wanted to start your subscription with never arrived, your "first" issue showed up several months later, and you only got three issues in total, it makes no sense that the last you waited isn't really your first time and for one reason or another, you didn't receive it to you. By your own admission, you don't normally wait several months after you received your first issue, which in turn was several months from when you ordered a subscription. So how many months passed before we could find our new user a problem? Six? There's no way we could have solved your problem if we weren't even aware of it. When you did notify us that someone who you apparently sent you a replacement copy, AGAIN, it probably sent you a replacement copy. Again, it's well written and really professional in its attitude.

Two found something interesting at two payphones at nearby restaurants. Both payphones can make long distance directory assistance calls toll free! You know,

area code, plus 555-1212. These are Western 6000 models.

AT&T long distance. Using the 800 number as page 45 of year 5 summer 1993 issue, I found both numbers. I won't disclose them now for obvious reasons.

Any comments? (The restaurant is right across from a US Sprint operating center.)

Noxapatre 1138
Ohio

It's a really bad programming. We've seen this sort of programming is done at the phone in all cases, since the phones can determine one CO/COT.

Dear 2600:

The neighbors in the Derby Inn at 1630 Canal Street, New Orleans, LA kept returning my quarter for local calls

of such a thing. And, for the record, our labels don't tell people to pay up - each label contains the date of the last issue of the publication, so other people don't know their activities. Writing to you is pointless and only serves to litter the streets after you have discarded this letter. No mention or provision is ever made on the 2600 outgoing message about when an actual human being is present and your answering machine is not answering your calls.

Never! Nobody has ever taken offense at this before.

Be glad you haven't suffered victim to these and fee enormous failing schemes the phone companies play on their customers.

We will readily admit that our "customer service department" sucks. We're not Time Magazine. But we never ignore complaints and, while we may be a bit slow to respond, everybody gets what they order. We just certainly answer every individual question we get, for a call back because all they have to do is listen to the call that comes in. Getting the magazine out and nothing else is all we do.

Care people get it are over bigoted priorities. So if

anyone knows every individual question we get, for a call

back because all they have to do is listen to the call that comes in. Getting the magazine out and nothing else is all we do.

Just don't have the time.

Now to address the irrational hysterics that

invariably mark the second part of your letter: do you

envision that our answering machine message is

part of a conspiracy? As we mentioned above, we provide

information to people who call. The best is to be helpful.

And we don't take a secret of the fact that you can't

ask to skip the message entirely. Of course, encouraging

people to ask such a possibility implicates us in yet

another conspiracy.

As for your contributing circumstances, we'll be insulted

do matter how long I talked. No complaints, but why is this so? Was it a defect in the phone? It was a Bell phone.

San Diego

In your case, the problem was never likely to occur if it was consistently happened with more than one phone, then the problem is definitely unusual.

Dear 2600:

HU: I've been reading your mag for a few issues and I personally think it's the greatest thing in print (next to the First Amendment, but it seems like nobody knows what that is anymore). Anyways, a strange thing happened to me at my local mall. See they've got these "strange" payphones, which I imagined to be COOTs. (No tele logos, some generic LD carrier, LED displays that say "MAIL" when you pick up the phone and then a timer of how much time you have left after you insert the money....) I tried out one of the methods for getting an unanswered dial tone on a COOT, namely calling a 1-800 number and causing them to hang up, then "hissing" in the receiver when I tried to reset. Well, I tried this about three times and it led nowhere, it would just get the "hang up and try your call again" message after the 1-800 (originally 470 kbytes) to equal 460 kbytes - the 10 kbytes decrease makes a big difference in timing and quantity. Since I couldn't find a resistor of that value in my collection, I just used one 240 kbytes and over 250 kbytes in series. With these simple changes, the "Quarter" became a bit crisper, and the timing error was changed to make the pulses always be 5 (.25 cents), and the tones are produced in quick succession, making it sound more realistic. The only downfall of using the two 3-volt batteries is that the volume is a little bit decreased, but it doesn't make a difference when the speaker is held to the phone.

Tim

Quarter Variations

Dear 2600:

This letter is regarding the "Quarter" device printed in the Summer (1993) issue. I'm sure you have gotten comments about this before. After building the "Quarter" I noticed that sometimes, the tones would break out and come out in groups of three (equivalent to a 15 cent piece) and the timing would be a bit off of what I had a few modifications to the circuit and came out with something a bit "cleaner". Instead of using a 9-volt battery or three AAA batteries (4.5 volts), I chose to use two CR2025 3 volt Lithium batteries. With 6 volts, it did the job and took up less space. I changed the value of R1 (originally 470 kbytes) to equal 460 kbytes - the 10 kbytes decrease makes a big difference in timing and quantity. Since I couldn't find a resistor of that value in my collection, I just used one 240 kbytes and over 250 kbytes in series. With these simple changes, the "Quarter" became a bit crisper, and the timing error was changed to make the pulses always be 5 (.25 cents), and the tones are produced in quick succession, making it sound more realistic. The only downfall of using the two 3-volt batteries is that the volume is a little bit decreased, but it doesn't make a difference when the speaker is held to the phone.

John

Hi. I call outside the 313 area code. Right, hi? Any ideas, people?

Oh, by the way, I seem to recall a Lesser-known/good called abomination that deals with the whole New World Order paracocial thing. Hope that helps. Almost anonymous.

Wag

The prison system uses pulse dialing to get to the official inmate locator outside the branch lines and outside their own carrier cells, so they disabled the track lines. In my view, the prison system has got nothing to do with AT&T, it's simply about 2007 calls per placed by the local company. There are an almost unlimited number of possibilities with your country system - 800's, 950's, carrier access codes, cellular calls, green hot lines from the called party, maybe even black holes if you're in a primitive area. If you do manage to get an operator, the trick is to make sure she doesn't see the other of service, which is unfortunately showing up as a prison phone. It's not easy and it's different in every area.

Government Data

Dear 2600:

I just bought the Autumn 1993 2600 Magazine. I love it!

Maybe I am too "old" to be a real hacker (I am 40) but I am very close to this world, being a programmer involved in the computer security field (Business Computer Security, etc.). I just heard recently that President Bill Clinton is a real poster of the information superhighway technology and there is a BBS system - an email front end to the White House. Can you please provide me with this number to send messages and to be in touch with these folks?

A.O.

Arizona

It's not exactly a BBS. It's a way to send feedback to the government over the Internet. The software is prewritten@whitehouse.gov and you provide@white-

gov. But I think for a second that this mail will ever be read by its recipients. Don't believe either that you can remain anonymous on the net. If you're really, really, you'll get a formal letter back.

Cellular Chatter

Dear 2600:

The Autumn 1993 article on "More Cellular Fun," started off good but it was soon obvious Jules Goren didn't know all that he was talking about. The Uniden phone uses a NEC945 located in an eight pin socket to all interface in the world free of charge, but not the 313 area code where the prison is located. They've since

updated the system so that this little trick won't work. 2) The county jail's phone system is a little different. I'm going to go down there in a little while so if it happens someone can figure this out for me. The jail's phones require payphones but accept money but don't allow you to use your calling card. I haven't tried calling 10288 for an AT&T operator, but I do know that trying to get an operator the old fashioned way (0) won't work. You also can't call outside the 313 area code. Right, hi? Any ideas, people?

Oh, by the way, I seem to recall a Lesser-known/good called abomination that deals with the whole New World Order paracocial thing. Hope that helps. Almost anonymous.

Wag

More Corporate Outrage

Dear 2600:

It has come to our attention that you have published one of our business, marketing 500 numbers in your quarterly and also in a hacker's bulletin board. The number you published is 1-800-775-555X.

Our service is a commercial caller identification

which operates throughout North America and provides

needed information to law enforcement agencies and

major businesses.

By publishing one of our lines as a novelty number to call for "fun", your disclosure is causing wasted time by

our staff and costing us only their time, but also the long

distance fees we pay while our lines are in use during

your subscribers' games.

We hope the posting that an 800 number had been

published by your service, which demonstrates

commercial caller identification services and is not to be

called for entertainment or curiosity purposes and that

such calls may cause civil and criminal prosecution for

misuse with intensive telecommunications

You are also hereby notified that all calls to this

number are being identified and callers will be contacted

regarding their abuse of this number, and your company

will be invited for the call activity at a rate of \$1.00 per

call.

We hope in the future you will take more precautions when shooting your readers to entertain themselves by disrupting business services.

is the software. The only downfall with hidden phones is that you need a Uniden "K-MAT writer" handle to change the MNP to match the ESN.

I should be writing an article soon on converting the payphones fast accept money but don't allow you to use your calling card. I haven't tried calling 10288 for an AT&T operator, but I do know that trying to get an operator the old fashioned way (0) won't work. You also can't call outside the 313 area code. Right, hi? Any ideas, people?

Oh, by the way, I seem to recall a Lesser-known/good called abomination that deals with the whole New World

Order paracocial thing. Hope that helps. Almost anonymous.

Truckee, OH

Tom

Blue Boxing Revisited

ACCCITT SYSTEM #5 INTERPRETATION

by Kevin Crow

This article will attempt to teach the reader basic CCITT-5 International signalling. More technical readers may enjoy reading the original CCITT-5 'RedBook', and can use this as a supplement.

During the time I've been working on this article, the ITU has changed the names of a few departments. CCITT is now known as the ITU-T, however for the sake of avoiding any confusion in terms, I will still refer to the signalling as "CCITT-5", or "C5".

CCITT-5 signalling is still known as the International signalling standard. CCITT-5 is related to R1 signalling, a substandard used from within North America. A highly stripped down version, R1 doesn't include any trunk signalling involving 2600Hz, and I won't be discussing it in this article. R2 Signalling, another substandard, is widely used in Europe, however I will not be covering R2 signalling in this article.

I have heard over and over again that C5 is no longer available for use in the United States, "since being the well-advanced country that we are" we have moved on to bigger and better things, such as CCS, and eventually SS7, and its Digital Mystery. I find it amusing that the UK has had ISDN for far longer than we have. I still prefer vinyl over CDs, and we've been able to get near-perfect connections with C5 that sound better than the new stuff (although this is strictly medium dependent, it's still worth mentioning). The reason I am addressing this issue is simply to remove any sort of beliefs you might have because of AT&T's propaganda over the years — booting is possible from anywhere.

Back in 1976, when CCS started hitting the scenes, there were many problems that immediately crept up. AT&T's breakup in the 80's didn't make the transition phase any easier, and in parts of the new Baby Bells (even today) you can find R1 Signalling. AT&T has since scrapped their implementation of CCS and is now using SS7 wherever it is possible. Do not let this

confuse you however — no matter what switch you're on, or how you're being routed to through a C5 connection, in most cases you will still be able to signal yourself. On with the show...

C5 signalling is broken down into eleven major groups of Signals. It is with these signals that all the necessary operations and functions are executed for (almost) error-free international switching. For two switches to communicate with each other they require the ability to send signals, as

well as receive them. They need to know which signals are being sent, and they need to know what to do with them. For the scope of this article, let us assume that all signals being sent from the originating switch are known as "forward signals", and likewise, all signals being received by the originating switch (or sent by the switch on the other side) are known as "backward signals". Of the eleven signal groups, six are signalled in the forward direction, and the remaining five are signalled in the backwards direction. The dialogue that happens between these two switches is really quite primitive, and therefore can be mimicked with \$20 worth of parts, as in the case of the blue box.

Let's take a look at the signal groups:

1. Seizing Signal — The seizing signal is sent in the forward direction by the originating switch. Its purpose is to initiate circuit operation at the incoming end of a circuit. It "seizes" the equipment for switching the call.

2. Proceed to Send — This signal is sent back in response to the seize, and indicates that the equipment is now ready to receive the numerical set of signals.

3. Start-of-Pulsing — Also known as (KP). The KP signal is a forward signal. It is actually broken down into two types of signals. Kp1 is "terminal", that is, it is used in placing domestic calls. The Kp2 signal is a "transit" signal, and is used in International Signalling. The purpose of the KP signal is to prepare the incoming switch to let it know what kind of

call it will be handling.

4. Numerical Signal — This signal is also a forward signal, and it provides the information necessary to effect the switching in the desired location. The numerical signal includes the actual phone number of the desired location, as well as some extra information that will be discussed later on.

5. End-of-Pulsing — This is also known as the ST (start) signal. It's a forward signal, and its purpose is simply to show that there are no more numerical digits to follow. In a sense, at this point, the call has "started switching".

6. Busy-Flash — This is a backward signal, and it is sent to the outgoing exchange to show that a) the route or b) the called subscriber is busy. The International Transit exchange sends this signal after the register association to indicate that there is congestion at that exchange, or the appropriate outgoing route. This signal is optional if there is congestion beyond that exchange. Upon its receipt, there is usually an indication to the outgoing operator or to the calling subscriber that causes the sending of a clear forward signal by the outgoing exchange to release the connection. This signal is never supposed to be sent after an answer signal, and only after a proceed to send signal (see below).

7. Answer Signal — Another backward signal, this one is sent to the outgoing exchange to indicate that the called party has answered the call. In a semi-automatic working, it also has a supervisory function, that is, it begins the initiation of watching over the connection. In automatic working, it is used to a) start metering the charge to the calling subscriber, and b) to start the measurement of the call duration for accounting purposes. Receipt of this signal also permits discrimination between the busy-flash and clear back signals. It also must never be sent after a busy-flash signal (see below).

8. Clear Back — Obviously a backward signal, it is sent to the outgoing exchange to indicate that the called party has cleared. In semi-automatic working, it performs a supervisory function as well.

and must not permanently keep the speech path from being open at the exchange. In automatic working, if the calling party has not cleared within one or two minutes of the clear back signal, arrangements are made to clear the connection, stop charging, and stop measurement of the call duration. It should also only be sent after the answer signal.

9. Clear Forward — This signal plays a very important role in both exchange signalling, and blue boxing. In exchange signalling, it is sent at the end of a call a) in semi-automatic working when the operator at the outgoing exchange pulls her plug, or if an equivalent operation is performed and b) automatic working when the calling subscriber hangs up or otherwise clears. It is also sent after the receipt of the busy-flash signal by the outgoing exchange and when there is a forced release of the equipment, including its idle condition (blue box enters, last stage). It also may be sent from an outgoing end at any time to initiate the release of a circuit. It is completely overriding, and it will break any other signal sequence.

10. Release Guard — This is a backward signal, and is sent in response to a clear forward. It also serves to protect a circuit against subsequent seizure. It will do so as long as disconnection operations (controlled by the reception of the clear forward signal) have not been completed at the incoming end.

11. Forward Transfer — The forward transfer signal is sent to the incoming exchange when an outgoing operator wants the help of an inward operator (see below).

You may have already noticed a few laws that must exist in order for this whole procedure to work. These "laws" are known as the "Signal Code". I will spare you the boring drudgery of these laws, and will not go into too much detail, except where is needed.

General information on Signal Code

thinking that they were another exchange somewhere off in the distance. This is basically accomplished by dialing through a C5 connection into another exchange (which is what happens when you dial those 800 numbers), and sending a clear forward signal. This will bring the switch out of idle mode (or whatever mode it was in). It will respond with a release guard signal notifying the boxer to proceed. The boxer then sends a seize signal, and again gets a response with a proceed to send signal. This is usually the hardest part for the boxer, since timing here is very critical. Countries differ in timings and sensitivity, so usually what works for one country won't work for another. The clear forward sent by the boxer usually consists of 2500Hz+2400Hz for 10-150 Milliseconds, followed by a seize of around 150-400 ms. Simply seizing a trunk on the other side isn't enough, however, since the boxer must also know the correct routing to get the calls through. Typically, International "transit" routes are of the most interest, and the boxer may send a traditional KP2 (indicating International call) + Country Code + 0 (for good luck) + City Code (or Area Code) + number + ST. Signalling numbers like KP2 12 415 121 ST will get them to an AT&T Inward operator, whose job is to talk with other operators and settle business by voice if it's not possible via direct routing. Allianca Telecommunications used to be a big thing in the past, and is still available today via blue box.

(which is what happens when you dial those 800 numbers), and sending a clear forward signal. This will bring the switch out of idle mode (or whatever mode it was in). It will respond with a release guard signal notifying the boxer to proceed. The boxer then sends a seize signal, and again gets a response with a proceed to send signal. This is usually the hardest part for the boxer, since timing here is very critical. Countries differ in timings and sensitivity, so usually what works for one country won't

I am not happy to say that blue boxing has gone into the wrong hands. Like all good tricks, they eventually become harder and harder to do until eventually they disappear — well, almost. Kids from all around the world have used the blue box for their own amusement, making calls to girlfriends they'll never meet, and to "warz" boards to do some software pirating. Even the great people who were at Apple Computers have been known to have played their part in releasing the beast. Now that the technology has fallen into the lower echelons, countries have had to make adjustments to their systems to combat these problems. The German Telecom has spent many marks on British Telecom "filters" that they've placed on C5 connections to try and stop some of the chaos — nice try. (The Germans have already figured out long ago that the systems on the other side will actually perform just fine out of spec, and, for example, instead of sending a 2600Hz or a 2400Hz signal, they'd send a 2650Hz or a 2450Hz — right out of the filtering bands.)

Slowly things are going towards S7, and the signalling is disassociated. By the time C5 is completely scrapped, there will probably be new ways to approach this blue box mystique. I haven't even begun to cover R2 signalling which yields much more fascinating results. (faking ANI, billing to others) but, unfortunately, it is out of the scope of this article. Maybe next time kids.

A GIFT FROM HALLMARK

By Bernie S.

My heart's out to FyberLyte for his efforts on The Magical Tone Box article in the Winter 1993-94 issue of 2600. While his efforts deserve plaudits, the week after his article saw print it became obsolete!

Once again, the mass market consumer electronics industry has succeeded in bringing down the cost of very sophisticated technology to ridiculous levels. Hallmark, Inc. (the greeting card company) has teamed up with Information Storage Devices, Inc. (who makes the chip Radio Shack sells which was used in FyberLyte's project) to produce the "Talking Greeting Card."

For a mere \$7.95, you can buy a completely assembled digital audio recording device (complete with speaker and microphone) built into a greeting card. The idea is to record your 10 second voice greeting on the card and mail it to the person of your choice. The possibilities abound....

If you take the card apart, you'll find a plastic and cardboard frame inside containing a tiny 1" square circuit board, four 1.5V watch batteries, two switches, a piezoelectric microphone, and a decent 1.5" 16-ohm speaker. This is basically the same thing FyberLyte took pains to gather parts for and assemble, except it's much smaller, much cheaper, and ready to go!

My hacker friends and I have removed these modules and concealed them inside all kinds of unlikely containers: a chewing-gum box, a Zippo lighter, a dental floss dispenser, even a coat collar! The voice band fidelity is quite good, and it's excellent for recording (and playing back) ACTS coin-deposit tones, Sprint voice FONcard codes, call-progress tones, telephone recordings, etc.

Thank you, Hallmark, for "carrying enough to send the very best" in a cheap, accessible, and readily hackable device!

10XXX

By The Prophet

One of the most misinterpreted and touted features of the post-becoming 10XXX is the notion of a code (also known as the 10XXX code). Since there are very few actual codes that work in all areas of the country, I have included only a very brief list of common tenx codes to get you started.

Tenx codes were instituted after the AT&T breakup in every RBOC in the vicinity of 1984/1985, and are continuing to be instituted in the non-RBOC (independent) areas of the country. In every area that has "equal access" long distance service, tenx codes are available. You also will tell you if you have equal access, but they will not give you a list of tenx codes for your area - you have to get those from your long distance carrier or by searching.

A tenx code is useful because it permits you to use a long distance carrier other than the one that is primarily assigned to your area. For example, if Daniels Tel is your primary long distance carrier, and you prefer to use Prizocom, you could dial Prizocom's direct access (such as a conference calling service), available only through Prizocom and not Daniels. Calls placed through tenx codes are billed by your RBOC, however, if you use an obscure carrier such as a carrier which usually deals only with CICOT's, sometimes you will not be billed for the call (the long distance carrier has to pay your RBOC to bill the call for them). Also, it can occasionally take a year or more for the call to be billed - it's usually several months.

Of course, there are many other uses for it. For example, some RBOCs will block calls to a LEC, but will not block calls to a timesharing. Also, it's useful to use the RBOC and go over the AT&T network (which can be used when the RBOC cannot be), and is some very small cities, it's possible to dial a 3000+AN, on a per-phone and not be billed for the call.

The formula for using a tenx is as follows:

Tenx+AN
Example: To ter AT&T to place a call to the 2600 Voice BBS.

10288-0-708-731-2600

Another example: To place a call to Vancouver using Sprint (Sprint has its own network into Canada so it is beneficial to use Sprint in bypass AT&T and other carriers benefitting from AT&T lines during network difficulties and emergencies).

1033-1-804-662-6397

BookLister of Tenx Codes

These are in almost equal demand across:

10288 - AT&T
10733 - AT&T private test network
10222 - MCI
10333 - Sprint
10444 - Alltel
10488 - Metromedia

NOT MUCH GOOD NEWS HERE

A trip to the library can reveal all sorts of fascinating items.

A publication called *Prosecutor's Brief*, described as the "newspaper of the California District Attorneys Association," had some rather shocking advice in its Summer 1990 edition. (Too bad we didn't catch this one sooner.)

In the lead story, author Jerry P. Colenzano proclaims, "Hackers of phone 'hackers' are not overly complicated, may be even fun, and can certainly assist your office's strained budget by providing a ready source of computer hardware."

According to California Penal Code section 502.7(g), "An instrument, apparatus, device, plans, instructions or written publication... may be seized under warrant or incident to a lawful arrest, and, upon the conviction of a person for a violation of subdivisions (a), (b), or (c), the instrument [etc.] may be turned over to the person providing telephone or telegraph service in the territory in which the same was seized."

But, according to the article, most of these companies will dismantle the equipment "right back to law enforcement." What a cozy arrangement.

Concerning monitoring, some of the revelations are pretty scary. It seems that pen registers operated by Pacific Bell double as partial wiretaps, and it's perfectly legal for them to record conversations without a warrant if it's part of a phone company investigation! The article states, "In the case of Pacific Bell, but not necessarily all other companies, the first 90-120 seconds of each call made from the tapped line is taped for the purpose of identifying the person(s) using the illegally hacked codes."

The article goes on to describe the ideal scenario: "If you are fortunate enough to receive the case before the search warrant has altered the hacking to the investigation, your most important decision may well be the length of time the DNR stays on the targeted line. Weighting in favor of greater DNR times are the desire for obtaining at least a \$400 felony loss and identifying with certainty the hacker. Those considerations must be balanced against the risk that the DNR and its attendant call content taping will be suppressed as being an

unreasonable privacy infringement, and the moral consideration of continued losses to the common carrier."

The "recorded substances" on the tape are considered a key bit of evidence since they identify the defendant. In addition, "any" notebooks containing handwritten authorization codes, phone numbers called, etc., can be compared to the known handwriting of the defendant (from booking slip and/or court-ordered exemplars). Don't neglect the seized computer's own memory banks - either its internal hard disk or say floppy disks may contain programs or files identifying the computer's user as the defendant."

District attorneys are also urged to look through the evidence for any "contacts among the hacker community" or BBS numbers.

Another "particularly fun" way of prosecuting a hacker is to look through his computer programs for games that have a listing of the top 10 scorers. "If your defendant's name appears close to the top of the list (or exclusively), it is quite reasonable to argue that having had the most time to play the game this successfully, the defendant must own the computer."

Another absurdity concerns the justification for seizing telephones, described as "entirely appropriate within the statute, and serves to drive home rather graphically to the hacker just how serious this matter of criminal prosecution is."

It's pretty obvious how serious computer crime is to district attorneys in California. Here is our first solid piece of evidence that they consider hacker cases to be fun and easy ways of getting other people's computer equipment for themselves. A true mockery of justice.

The CDA can be reached at 916-443-2017.

Another fascinating document was recently obtained by 2600 - the full transcript of last year's Congressional hearing which turned into a hacker bashing courtesy of Rep. Edward Markey (D-MA) and Rep. Jack Fields (R-TX). It's far too long to reprint here but you can get a full copy for \$10 from the U.S. Government

Printing Office, Superintendent of Documents, Congressional Sales Office, Washington, DC 20402-9315. Tell them you want the hearings number 103-53, stock number 552-070-15676-2470. There's hours of entertainment here.

For the last two issues, 2600 has actually been on sale at CompUSA, the computer superstore. For a while we were concerned that we were becoming too mainstream but our fears need not be unfounded. Apparently someone at CompUSA Central decided to read a copy. Result: They have decided to "partialedly remove 2600 from their stores". The problem is, so many people found us at CompUSA that they're now being inundated with calls from people wanting to know why we suddenly disappeared. How do we know this? Don't worry, we know.... *

Trouble on the information highway: the biggest telecommunications merger in history will never be history now. Bell Atlantic and TCI, two of the biggest entities of any sort on the planet, decided to break off the engagement and blame it all on the FCC for regulating rates. If we only knew it would be that simple.... The Clinton Administration is becoming obsessed with monitoring citizens.

On February 4th, the Administration rejected

all of the criticism it has received on the Clipper Chip proposal and announced plans to move full speed ahead with its implementation - on a "voluntary" basis. The Clipper Chip would allow law enforcement to eavesdrop on phone calls that use the government standard of encryption. Civil liberties groups have strongly condemned

Clipper and its companion Capstone (for data encryption) because of the potential for abuse

and widespread monitoring of citizens. This technology is being developed with the help of the NSA, an organization that's supposed to keep its monitoring activities outside our borders. And that's not all. More recently, the administration reintroduced a digital telephone proposal that would require phone companies to provide real-time traffic analysis to all law enforcement agencies. Unlike a pen register, this is an ability that will always be there, one which simply has to start to get stupid.

be turned on. The data would then be sent to a remote monitoring post. According to the Electronic Frontier Foundation, such information amounts to more than just the numbers we dial. "As we all come to use electronic communications for more and more purposes," a recent press release says,

"this simple call setup information could also reveal what movies we've ordered, which online information services we've connected to, which political bulletin boards we've visited, etc. With increasing use of telecommunications, this simple transactional information reveals almost as much about our private lives as would be learned if someone literally followed us around on the street, watching our every move."

Some new area codes that will be debuting in 1995: 334 (Alabama), 360 (Washington State), and 520 (Arizona). These will be the first area codes not to have 1 or 0 as the middle digit. Look for many more.... We discovered quite by accident that WilTel Communications passes Caller ID data across state lines and they seem to be a lot better at it than Cable & Wireless. For one thing, anyone can access WilTel by using their carrier access code (10XXX). Cable &

Wireless doesn't allow outside use of its code (10225). Customers who use WilTel stand a very good chance of having their phone number passed on to the called party.

Regardless of whether or not they've blocked it.... Speaking of carrier access codes, get

accustomed to the 10XXX system of using

different long distance companies, it's all

going to change. Yeah, no kidding. It seems a thousand possibilities are not ledger enough.

Strange, we never seem to have more than a

handful of choices in any one part of the

country. But someone out there is using all of

these codes, so the rest of us must adjust.

Starting in 1995, you will dial with the format 10XXXX. That's right, seven digits, not

five. The 500 and 6000 number ranges will

be used for new carriers. If we assume that

AT&T's new code will be 1010288 (no codes are known yet), the dialing instructions to

reach our voice bulletin board will be:

1010288-0100-751-2500. This is really

LETTERS

(Continued from page 31)

possessions from us during the bootlegging procedure, settled at an enormous \$5,000 each, and facilitated the arrest records to support the felony charge. Of course, the prosecutor read the law and withdrew the felony charge; the charge was supposed to apply to anyone who placed an explosive within 1000 feet of a switch.

The sheriff did not want to be embarrassed, however, so they convinced the prosecutor to replace the felony charge with a misdemeanor trespassing. Now, we were walking along, were only 20 feet from a major street, in an area that was not fenced off, passed trespassing, or sensitive in any way. Yet, we were technically trespassing, and we were prosecuted, convicted and pleading guilty (only because we could afford a lawyer), and the public defender never even responded to our hearing, and I actually served 30 days jail time and 1000 hours of community service. All this because I walked along some train tracks.... The negative ramifications of this error took years to overcome, and cost thousands of dollars in lost wages, bail bond fees, legal fees.

The point is, once law enforcement officials begin an investigation or make an arrest, they will do almost anything to avoid the embarrassment of having all charges dropped or the "charged" going free. Better to lock up a couple of kids for robbing than admit they shouldn't have arrested them in the first place. Unfortunately, when it comes to barking, law enforcement is clearly as argue and abashed as x is in the rest of America. If not worse. Palmer-Opalk has my sympathy, and the police have my contempt.

Rader X

Thanks for sharing that. Stock reporters used to be told to others so we can all be the new lookout for justice, and for those who want to stay in touch with Palmer Opalk, his address is: Mark Abene 32109-454 FFC, Schenectady Unit 1 P.O. Box 670 Maywood, PA 17554-4570 All incoming mail is read by prison authorities. The only thing allowed are letters and non-hardcover printed names. Only keep publications out of banfitter books.

Correction

Dear 2600:

Just mailing you to point out an error on Pyburn's "The Magical Tone Book" article that appeared in this past Winter edition of 2600. At the end when he discusses the use on the Tone Book for blue boxing he includes "So, to sum it up, hit 1, 2, dial on the phone's keypad (or your own dialer), then 3." Now anyone with basic blue boxing knowledge knows this does not work. Why? Because DTMF is not equal to

ME. The tone pairs used for DTMF signaling of numbers are not the same as those used in ME; therefore you must also record those tones. Not that this is difficult with the Tone Box. I must say it's a great alternative to building a blue box using VCO's (Voltage Controller Oscillators). In any case, thanks for a good article.

Phone Company Charges

Aleph One

Dear 2600:

I was just reading the letters page for the Autumn 1993 issue and realized that if I did not comment on the complaint of 5e/9c about the cost of CID, I would be remiss. I do not mean to defend the phone company, but the cost of enabling CID does not pay for the "Tipping off" the service, so much as it pays for the cost of paying someone to man the phones to answer the requests. There are probably a lot of other hidden costs, including extra software to make CID work and upgrading of switches. If one does not want to pay for the expense, one does not have to. I'm tired of seeing hackers complain about cosa without taking a holistic view of a situation.

In the Winter 1991-92 edition, Will Chung writes that total expenditure is added when caps are placed in series. Actually, in series, capacitance is calculated the same way resistance is calculated in parallel. To add caps in a linear manner, place them in parallel.

To sum up:

Clock = $C_1 + C_2 + \dots + C_N$

In series capacitors add in

$I_{\text{Clock}} = I_{C1} + I_{C2} + \dots + I_{CN}$

This could prevent needlessly wasted debugging effort....

David

Thanks for the correction. As far as a charger for Caller ID, we believe that it easily violates water you to think. You do need to pay the people who answer the phone. But surely the monthly charges will all pay off. We do not believe that you are sufficient for this. We do not consider service representatives are demanding extra pay for every Caller ID request they process. While leaving the cost of paying for the new technology. That is an investment by the phone companies. Their profits (of which there is a substantial amount) go into their investments and, if more people use more phones - which by every account is clearly what is happening - then the increased usage of charging fees is additive to this is where stand, in and the phone companies have no right to negotiate.

DO YOU HAVE A LETTER YOU HAVEN'T SENT US?

Without taking a holistic view of a situation.

In the Winter 1991-92 edition, Will Chung writes

that total expenditure is added when caps are placed in

series. Actually, in series, capacitance is calculated the

same way resistance is calculated in parallel. To add caps in a linear manner, place them in parallel.

To sum up:

Clock = $C_1 + C_2 + \dots + C_N$

In series capacitors add in

$I_{\text{Clock}} = I_{C1} + I_{C2} + \dots + I_{CN}$

This could prevent needlessly wasted debugging

effort....

David

Thanks for the correction. As far as a charger for Caller ID, we believe that it easily violates water you to think. You do need to pay the people who answer the phone. But surely the monthly charges will all pay off. We do not believe that you are sufficient for this. We do not consider service representatives are demanding extra pay for every Caller ID request they process. While leaving the cost of paying for the new technology. That is an investment by the phone companies. Their profits (of which there is a substantial amount) go into their investments and, if more people use more phones - which by every account is clearly what is happening - then the increased usage of charging fees is additive to this is where stand, in and the phone companies have no right to negotiate.

THE ANARCHISTS' BBS. A computer bulletin board resource for anarchists, survivalists, mercenaries, investigators, researchers, computer hackers, and phone phreaks. Encrypted e-mail, electronic exchange, remote login, Gopher, BBS, BBS/BBS by modem. WANTED: Operation Information manual for Western Electric 145A test set and/or current hacking and phreaking info. Send to: Gray Area Newsletter, P.O. Box 3000, Memphis, TN 38108-0008.

PROTECT YOURSELF! Sewing hot red pepper 50/50

10% Quinone Caproic, more efficient than by other

1400 law enforcement agencies. Including NYPD and LAPD. Instantly disable databases for 45 minutes. Please

trojans in the u.k.

by Veghead

Many installations, in the UK at least, now favour PCs as terminals to their UNIX machines. My college for example uses a large ethernet setup running Sun Microsystems PC-NFS to access their various UNIX machines, using a PC version of TELNET. I noticed a gapping role in the security:

As login authentication for the ethernet, PC-NFS has a DOS-based login program, similar to Novell's, that compares a given password to that found in /etc/passwd on a pre-specified UNIX machine. Stupidly, it'll take the uid and password from the command line, so to log in I could type:

```
net login myuid mypassword
```

Trojanising this meant writing a bit of C code that would intercept the net command, save any interesting info (such as the uid and password) in a secret file, and pass the original parameters on to the original NET program, which would be none the wiser. This meant that to the user, nothing odd would have happened - no authentication errors to put them on the scent. In fact, it was marginally more complicated than this as the NET program interprets any parameter as "" to mean "ask the user". For example,

net login •

will make the program respond with

Enter username:

Enter password:

But overcoming this wasn't really a problem, the Trojan would simply put the questions to the user and then pass them as parameters to the real one (not forgetting to kill the echo on the password). It worked like a well-oiled dream!

I was considering the idea of a "generic Trojan" that could be used in all manner of situations without the need for re-writing the actual code. What I came up with was a badly written bit of 8086 code (I called it Kevspv) that does the following:

- When executed, hooks Int 15h and TSRs (terminals and syscalls resident).
- Records the next forty keystrokes the user makes using the "Keyboard Intercept"

interrupt. (So don't try and run it on old style keyboards - it won't work)

3) Next time it's executed it dumps down the key scan code into a disk file, unblocks itself from the interrupt table and releases the 1K or so of memory it's been holding hostage up until then.

What use is this? Ok, what would happen if you run it before running PC-TELNET? The next user to come along would notice nothing wrong and would hopefully log in. At the time, the program would be moving down everything the user was typing. Later on you go back, run it again and it will obediently supply you with a file containing the first forty scan codes of the keys the user had hit.

One way of getting round traditional Trojans is to log in twice. Firstly with a dummy password like "FUCKYOU", so if the program has been trojanised you don't get caught and the hacker gets a message. Even if the above user had done this, they would still get caught.

On our network all software is run using a networked copy of a DOS menu called Automania. All that needs to be done is to insert a command to run Kevspv into the menu code before and after it runs TELNET. Then, when anyone uses TELNET from anywhere, Kevspv supplies a copy of their keystrokes to a centrally located file where I can pick them up from.

Ideally, you would have a program that would dump the info to a file itself, without having to be run again but it would make the code far more complex with loads of undocumented calls etc. and quite frankly, I couldn't be arsed.

Adventurous programmers could then adapt that program to allow it to wrap itself around an executable file, infecting it so to speak. That way it would be almost undetectable.

The other real downer is that it saves scan codes and not ASCII or anything useful like that. It's necessary to write a program that converts the alphanumeric scan-codes to ASCII for your particular keyboard.

The Chrome Box

by Remote Control

Emergency vehicles in many cities are now using devices called OptoComs. OptoComs are sensors on traffic lights that detect a pattern of flashes from vehicle-mounted strobe lights.

This flash pattern varies from city to city depending on the manufacturer of the equipment used. Often the sensors are installed only at major intersections. Nevertheless, the Chrome Box, which simulates those strobe patterns, can often be used to give your car the same priority as an ambulance, paramedic van, fire truck, or police car.

Because of the varying patterns on different systems this article will outline a general procedure for making the Chrome Box.

Decoding Flash Patterns

First, you need to observe an emergency vehicle in action. You can wait until you encounter one by chance, running out to see when you hear a siren, or pulling over in your car to let one pass by. You might wait near a fire station for the next emergency to occur. Or, if you are very impatient, you can summon one by calling in a false alarm (not recommended).

If the OptoComs in your area are the kind with a pattern of single flashes at a steady rhythm, you have merely to buy a strobe light at Radio Shack and adjust the flash rate until you can induce a traffic light to change. If the flash pattern is more complex, you can videotape the emergency vehicle and then play back the tape in single-frame mode, counting the number of frames between each flash. Each video frame is 1/30th of a second. Using this you can calculate the time between flashes in the pattern. Another way is to count the number of flashes (or flash-groups) in one minute and use that to compute the rate. Counting video frames will give you a good idea of the spacing of the flashes in a complex pattern.

For really accurate information, call the fire station and ask them, or write to the manufacturer for a service manual, which will include a schematic diagram that you can use to build one. A good cover story for this is that you are a consultant and one of your clients asked you to evaluate Optocom systems, or you could pose as a freelance journalist writing an article.

Modifying the Strobe Light
You may not have to modify the strobe at all. But if you need a faster flash rate than your strobe allows, open it up and find the large capacitor inside. Capacitors are marked in microfarads, you can increase the flash rate.

Having the microfarads doubles the rate. The other component that can be changed is the potentiometer (the speed control device with the knob on it). Using a smaller value (measured in ohms or kilohms, whatever) with the greek letter "omega" or the letter K will speed up the strobe. There may also be a resistor (small cylinder with several colored stripes on it, and wires coming out of each end). Replacing this resistor with one of smaller value will also speed up the strobe.

To generate a complex pattern, you will either have to design and build a triggering circuit using IC chips, or rig up a mechanical device with a multiple-contact relay switch and motor. It has been done. To modify the strobe for mobile operation the simplest thing is to get a 110-volt inverter that will run off a car battery by plugging into the cigarette lighter and running the strobe from that. Or, you can figure out (or find in a hobby electronics catalog) a strobe circuit that will run from batteries. Battery-powered strobes may also be available, either assembled or as kits.

Sleight Technology
Most light sensors and photocells are more sensitive in the infrared area of the light spectrum. Infrared (IR) is invisible to the human eye. Putting an infrared filter over the strobe light may allow the Chrome Box to operate in traffic undetected by police or other observers. IR filters can be obtained from military surplus strip scope illuminators, or from optical supply houses like Dew-Corning or Edmund Scientific Co.

Using the Chrome Box
Mounted on your car, the Chrome Box can guarantee you green lights at major intersections that have OptoComs.

Handheld Chrome Boxes may be used to create gridlock by interfering with the normal flow of traffic. If you have access to a window overlooking a traffic light, you can play pranks by switching the signals at inappropriate moments, or you can plug the strobe into an exposed outlet at a laundromat or gas station.

Some Decoded Patterns
Torrance, California - Standard Large Radio
Shark strobe lights are used. Moderately fast rate.
Marinette Beach, California - Flash pairs in a 4:1 ratio, at a rate of two flash-pairs per second.
Please send in any new patterns we let you discover.

2600 MEETINGS

Gainesville on South University	Baton Rouge, LA.	New York City
Austin	30th Street Amtrak Station at 30th & Market, under the "Stineel" sign. Telephone: (212) 222-222-9388, 9382, 9381, 9379.	9211 8027, 808-824-8182

		All meetings take place on the first Friday of the month from approximately 5 pm to 6 pm local time unless otherwise noted. To start a meeting in your city, leave a message and phone number at (516) 751-2600.

The Shirt

The Video

You won't find it in clothing stores. (We did, but that's a long story.) The 2600 hacker t-shirt could be the fashion statement of the nineties. After all, anything is possible. Two-sided, white lettering on black background, true box schematic on the front. Hacker-newspaper articles on the back. \$15 each, two for \$28. M, L, XL.

Actual storage of data hacking pertaining a United States military computer system in the summer of 1991. This is not a secret videotape. These hackers turned this to show everybody just how easy it really is. In fact, a small part of this tape was shown on *More & More TV*. This version tells the whole story and runs about 30 minutes. \$10. VHS, VHS-C, VHS-C for portable play.
