SNINBOW 0009

boud as you have to wait an eternity for each commands from the menu or add others. When since system managers may opt to omit tedious and time consuming especially at 300 you can attempt to login, thus becoming very hacking a system, this menu will appear before This menu may vary from system to system.

switched networks, in which you may have to systems to select from, or "VM" may not be a an MVS/TSO system. There may be other IBM specify "VM" for a VM/CMS system, or "TSO" for commonly found on Telenet and other packet valid system. You may also have to specify to Host", "Press break key to begin session" and operating systems ... "Invalid Switch Characters". The last response is and harder to learn. "Compared to other "LOGON VM" or just "LOGON" before the port VM/CMS is cumbersome Other responses after connecting are "Ready

be extended). A typical logon may look like due to customization of systems, it's possible this and even the 8 character password limit may systems you come across this will be true, but the first character must be a letter (in most userid can be from 1-8 characters in length, but sciector connects you to the host system. LOGON can be abbreviated as just "L". A

L COMOSOLO SYSGUESS MOIPL

part of the CMS system. This is another different real computer console. Basically it "boots" your device in the VM/SP directory should not be used concept. A user can boot (or crash) their part of button and the device address switches on the for an automatic IPL. IPL simulates the LOAD system. NOTPL specifies that the TPL name or only login qualities allowed for the VM/CMS SYSGUESS is the password, and NOIPL is the command, COMOSOLO is the userid the system, not the whole system (in most " is the system prompt, L is the LOGON of two messages

MS6 userid missage (Example: MS6 VMUSER3 cases). NOT'L would be used when a system directory. This should allow you access to the will prevent this program from running if it is or no mobility such as a restricted menu of dumps you into a program which allows you little to be done upon togon. NOIPL is somewhat run within your PROFILE EXEC which lists things system. Otherwise the program was specified to listed in your automatic JPL entry within the CP you off without gaming access to CMS, NOIPL options (i.e., a system backup utility) and logs /NOCOMMAND" for DEC's VAX/VMS systems. similar but not identical to the login qualifier

availing yourself of the system's generosity of userid and password on one line (especially at informing you when an invalid userid has been passwords in a shorter period of time while still 300 baud) is that you can try more userids and prompts you for it. The advantage of entering the password on a separate line when the system not "masked". Thus, you will have to enter your anyone who may be watching as the password is invalid format message whenever the userid and installed on the system, you will receive an from entering their password in full view of password are entered on the same line. This is byiously a security measure to prevent users If the Password Suppression Facility is

bror messages

encounter while logging into a VM/CMS system The ones you should be most concerned about There are various error messages one may

not changed this is a mystery to me. when a valid ID has been entered. Why IBM has valid userid is half the battle. The other half is userid has been entered, you will receive this operating systems no longer give an indication of obtaining a valid password. Even the weakest system comes from telling the user when a valid message. This indication gives the hacker a username has been entered. After all, obtaining a system. Probably the largest security hole in any distinct advantage for gaining only to the Userid not in CP directory. When an invalid

attempt to log you on. If not, you will receive one do so. If the password is correct, the system will asked to enter a password if you did not already When a valid userid is entered you will be

None numbers are shown more than once because they have been transferred from one state to another or have been divided for use among certain geographical locations. No new 700-series railroad numbers have been issued since July 1, 1963. These are used by credit agencies and other services when verifing birthplace, tracking down individials, or for use in creating new identification.

listening in: catch me if you can!

by The LNA Master

Are you tind of watching scrambled video from HBD and the Movie Channel, etc. ? And you don't want to watch Dr. Gene Scott or Jerry Falwell or any of the other TV preachers? Do you feel your satelyte dish is going to waste? Well, here's scritching fun you can do with it.

In addition to receiving video and audio signals, your satelline dish can be used as a wiretapping device. Yes, some of you can actually wiretap from your own living norn—a fact you probably didn't know. Wiretapping is inlegal, but as the title of this article says, catch me if you can. It's virtually impossible to detect this particular brand of listening in.

All you nood for this project is your basic home satellite dish antenna, also known as TVR0 or televison receive only. What you need to do is turn to the AT&T satellite known as Telstar 301. You'll notice between Channel 20 and 23 (that is, Channel 21 and 22) you'll see a blank screen as if there were a station there. You won't hear anything except maybe an occasional garbled sound.

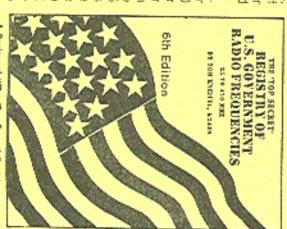

be able to listen in on AT&T calls to area orde receiver to where you believe 2600 is coming in continuous tone of 2600 hertz. Tune your 808, 809, and 907 perfectly. Then listen for a click followed by MF not hear a phone conversation, you will hear a (blue box) tones followed by a ring. You will then kilchertz there is a phone conversation. If you do many phone calls to listen to? About every 3% would have dreamed there would have been that Canbbean than you ever thought possible. Who calls to Hawaii, Puerte Rico, Alaska, and the either on Channel 21 or 22. You will pick up more megahertz. Make sure your satellitle receiver is broadcast band (1.6 megahertz) and 7.5 lower side band (LS8) anywhere between the satellite receiver. Tuno the shortwave receiver on shortwave to the video out terminal on your rregacycles). Connect the antenna input of your (covering between AM broadcast band and 30 Take a general coverage shortwave receiver This is what you do to listen in en phone calls

For frequencies above 4.1 megahertz, switch go to upper side band (USB). Also, you can tune in Channel 8 of Telstar 301. If appears that Channel 4.8 on your standard satellite receiver box switches

to the US Sprint service from the mainland to Hawaii. Sprint codes can be (and have been) gotten successfully by listening to the calls, interesting conversations are all over the place, such as the man from Long Island who has two wives and was promising the second wife over the phone that she could stay in his house in Hawaii until he "got rid of" wife number one

Telstar 301 can be found at 96 W on the satellite dish. Spacenet 2, which is located at 69 W is all US Sprint. Domestic calls as well as overseas calls can be monitored.

Other interesting satellites are ASC1 at 128 W. Westar 2 at 79 W, and Comstar D4 at 76 W. On these simply tune across until you hit a blank channel that looks like it's carrying a signal. Then tune the shortwave receiver anywhere between 1.6 and 7.5 megahert. If the conversation doesn't straighten up, switch to USB or USB on the shortwave

A Review of "The Top Secret" Registry of U.S. Sovernment Radio Frequencies" by Mr., Isom

Scarner listening seems to have a certain mystique amoung phreaks and hackers, particularly in regards to tistening to mobile/cordless/ositularphones, and certain government agencies. However, unlike mobile phones, whose frequencies are well known, the feds frequencies appear to be hidden away from
